

NOVEMBER 14, 1949 ZU CENTS YEARLY SUBSCRIPTION \$6.00

Studebaker Champion 2-door sedan

## This "next look" in cars is a more-for-the-money look!

THIS BREATH-TAKING new 1950 Studebaker is so distinctive, it looks expensive. But it's one of America's really low-price cars.

Most people can scarcely believe their ears when they hear how little it costs.

You get impressive operating economy along with the "next look" styling of this dream car. It's a 1950 Studebaker of increased wheelbase and over-all length-but it's trim and sleek-designed with sensible savings of poundage that save you plenty of gasoline.

Stop in and see this more-for-the-money lowprice car at a nearby Studebaker showroom. Sedan, coupe and convertible body styles.

## New 1950 Studebaker

Styled ahead for years to come!

More for the money inside! Even the lowest priced 1950 Studebaker Champion has richly appointed, decorator-styled interiors, ultra-fine appointments. The handsomely upholstered seats are restful as lounges. Hip room, leg room and head room to spare.

More-for-the-money safety! Rounding turns is almost like straight-away driving. Every inch and pound of a 1950 Studebaker ride in almost perfect balance. Symmetrically centered variable ratio steering. Selfstabilizing new coil-spring front suspension.

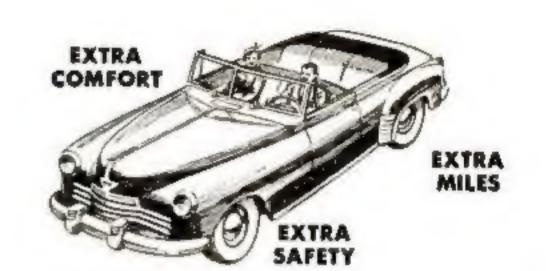

More-for-the-money comfort! Touch a switch! Warmed fresh air circulates evenly throughout the car thanks to Studebaker's Climatizer. This thermostatically controlled heating, ventilating, defrosting system is available in all 1950 models at added cost.

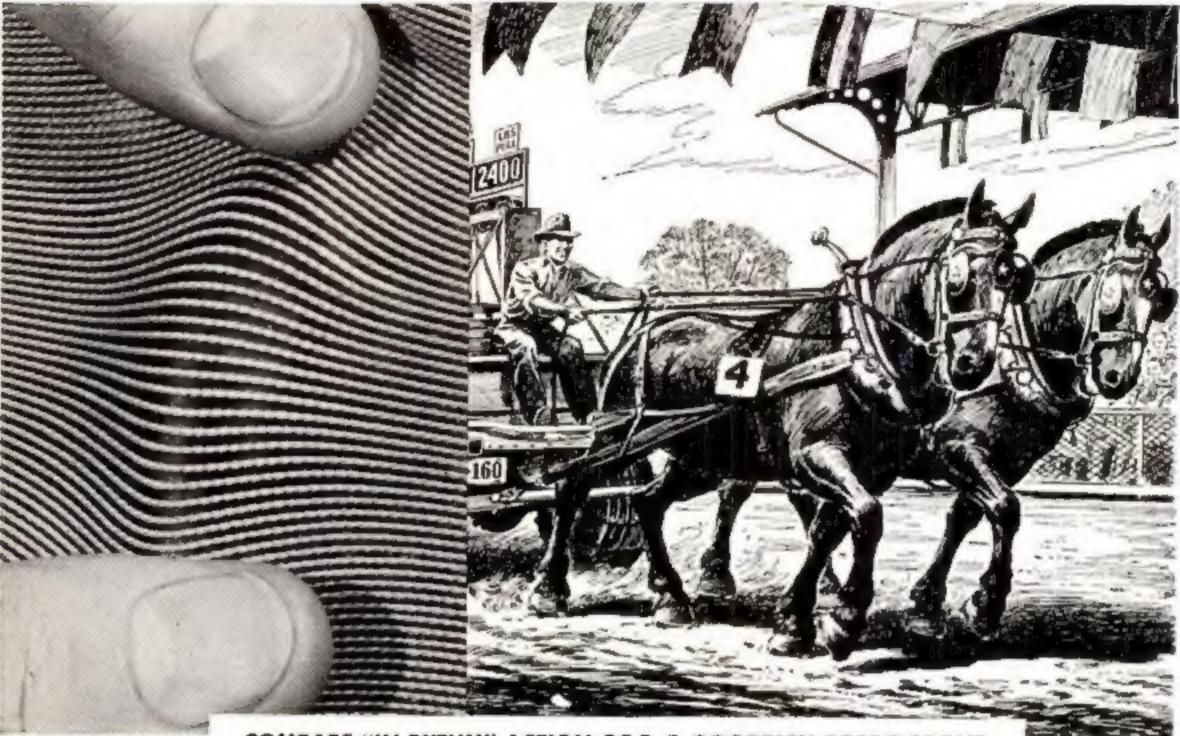

More-for-the-money craftsmanship keeps every 1950 Studebaker survivingly soundexceptionally free from the need for frequent repairs and adjustments. Every car is the pride of numerous father-and-son teams, @ 1949, The Studebaker Corp'n, South Bend 27, Indiana, U.S.A.

# New B.F. Goodrich

"Rythm Ride"

COMPARE "IN RYTHM" ACTION OF B. F. GOODRICH CORDS ABOVE WITH "OUT OF RYTHM" CORDS BELOW

# "RYTHMIC-FLEXING CORDS" MAKE THE DIFFERENCE

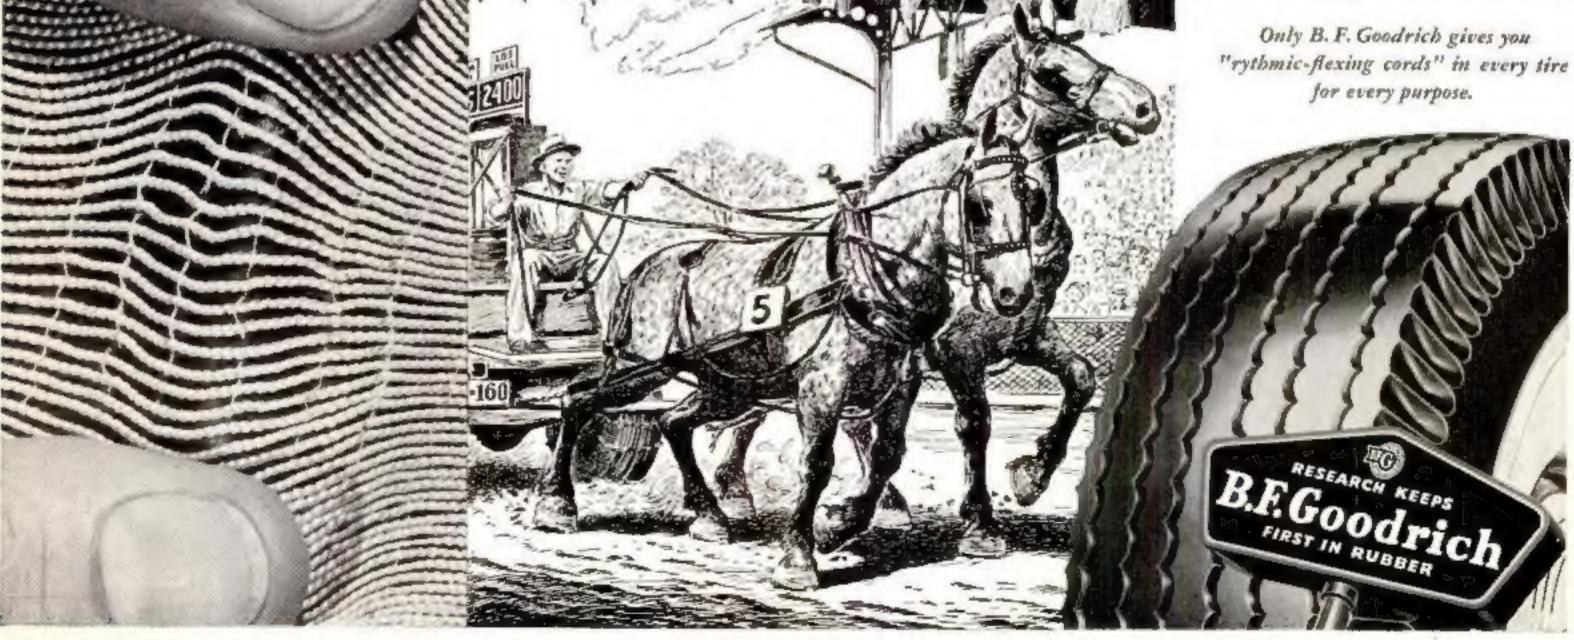

Compare B. F. Goodrich tire cords (at left) with the cords of most other tires (below). B. F. Goodrich cords have NO CROSS THREADS to "hobble" their action. They work in rythm like a team of horses pulling together—not unevenly like two horses working against each other.

Each BFG cord is sealed in rubber, perfectly spaced, under exactly the right tension. All cords share the load and impact equally. No "slacker cords". No over-strained cords. No bunching or gapping. All cords work together to cushion the shocks for more comfort. To resist bruises for more safety. To share the wear for more mileage. To give you a "RYTHM RIDE"!

See the big difference in tires today at your B. F. Goodrich retailer.

### COLD RUBBER, TOO-FOR EVEN MORE MILES!

The new longer-mileage cold rubber—
pioneered by B. F. Goodrich in 1941
—has now been added to BFG passenger tire treads. Get extra miles with the
cold rubber tread. Extra miles with the
"rythmic-flexing cord" body. Both in
the same tire at no extra cost. Plus a
big trade-in allowance for your old tires!
Smalldown-payment, convenient terms.

# you can't wash AWMUSS out of your hair

Shampooing alone can't remove that dull, lifeless look that dryness brings. But wella kolestral can! Give your hair the chance to absorb its softening, beautifying ingredients—and see how much softer, richer, more radiant your hair can look! It's a simple treatment. Pleasant. And oh-so-effective... so immediately. To keep your hair glamorous, gleaming with highlights—always—use wella kolestral after every shampoo. Ask for the professional treatment at your favorite beauty salon. Or get the new, convenient "take home" package.

THE WELLA CORPORATION, 104 Fifth Ave., New York 11, N. Y. \*REG. U. S. PAT. OFF.

WELLA\* KOLESTRAL\* conditioning cream for dry hair and scalp...

adds softness, silkiness to dry, brittle hair.

gives gleaming highlights to dull, lustreless hair.

conditions over-processed permanents, bleached, tinted, or neglected hair.

assures better permanents, more uniform color rinses, more manageable hair-dos.

guards hair against drying effects of sun, steam heat, frequent permanents and bleaches.

# Picture of a Successful Man...

If he could accomplish this why not you?

He owns his own home, sends his boys to college, has money in the bank and his family provided for. And you and the world say: "There goes a successful man." But did you ever stop to think that he might be just an average citizen with average earnings, who had the good sense to look ahead, and who believed that the three important steps to financial security were (1) INSURE—(2) SAVE—(3) INVEST ... It is never too late to take these three steps to security—nor is it ever too soon to begin.

First -Insure to give you and yours protection against injury, illness or death. Millions of Americans turn to insurance companies for such security.

Second -Save to safeguard your future. Make a steady weekly or monthly deposit in your savings accounts-to build up a substantial cash reserve for life's emergencies.

Third -Invest to get additional income-to make your surplus dollars work for you. Naturally, you cannot look for income when you seek the protection of insurance and while your savings account means safety, such dollars can only earn interest of 1% to 21/2% ... That is why-when it comes to investments-

## A Million People Turn to Investment Companies

Investment Companies like Insurance Companies, Savings Banks and endowment funds follow the time-tested principle of diversification.

A million people have found the road to substantial income (31/2 to 5% or more) by turning to Investment Companies, Two billion dollars of the public's money is invested in such funds. When you buy the shares of Invest- 31/2% to 5% ment Companies, you share in the ownership and growth of American Industry—the nation's successful food com- money panies, electric power companies, oil and automobile companies - in the foremost fields of American enterprise. In fact the shares of Investment Companies represent an interest in 30 to 100 or more carefully chosen corporations.

And the rate of income on your investment is the same per Everyone share whether you invest \$500 or \$1,000,000. For all investors share alike in the benefits of such mutual funds just as in Life Insurance Companies and Savings Banks.

The men who manage Investment Companies devote Skillful infinite time to the care and supervision of the money entrusted to them. Men who make constant studies of business conditions. Men with seasoned experience in analyzing and selecting securities. In this way the shareholders of Investment Companies can enjoy peace of mind, knowing that their investment problems are in the hands of specialists who are qualified to handle them.

### Consider Again These Advantages

- 1. Income of 31/2% to 5% or more-largely depending on the types of securities your shares represent.
- 2. "Ownership" not just in one or two stocks, but in 30 to 100 carefully chosen securities.
- 3. Skillful continuous supervision of your holdings by trained specialists.
- 4. The opportunity to share in the growth and progress of American Industry ...

NOTE: All Investment Companies operate under regulation of the U.S. Government,

Why not consult any one of the firms listed on the opposite page-and let them help you select the Investment Companies best suited to your needs.

### LETTERS TO THE EDITORS

### SWEDEN'S IDEAL TYPE

Sirs:

Miss Haide Göranson (Life, Oct. 24) is the prettiest girl Life has ever had on its cover.

GEORGE G. DERANIAN

Annapolis, Md.

Sira:

What is the fastest way to Sweden?

JIM KINLOCK

Berkeley, Calif.

Sim:

After seeing pictures of Haide, we'd like to know if Sweden could use a fire chief, assistant fire chief, captain and 26 firemen. We can leave tomorrow.

WILL H. PERRY JR. Captain

University of California (Davis campus) Fire Department Davis, Calif.

Sits:

Enjoyed your rather conservative coverage of Sweden's ideal type. However, Heute, a central European magazine, handled the same material (and what material!) and failed to cover her as thoroughly as you did. Thank goodness!

OTTO H. STEINER

Denver, Colo.

MORE OF HAIDE

Sirs:

Undoubtedly Miss Haide Göranson will, as a result of your write-up, receive at least one offer from Hollywood. I hope she accepts, for she certainly would be a welcome change for most moviegoers.

ROGER D. HAMPTON

Tyrone, Pa.

• Haide has received offers indirectly from both 20th Century-Fox and Universal but hasn't made up her mind on them yet. With a candor and innocence very foreign to Hollywood, she says, "As I cannot act much, I see little future for myself in the movies."—ED.

### FIGHTING IRISH

Sire:

We at Notre Dame like the words of praise you heaped on our football team (Life, Oct. 24), but do you mind if I correct an empression the article might give? Football isn't a religion here—and it's not murder either. It's a sport. It is not unusual for Catholics (or non-Catholics) to pray for success in any activity. Notre Dame isn't the only school where athletes go to Mass and Communion before a game. At many a state university the Catholic players on the football team get together and do the same thing on game mornings.

TED PRABINSKI

Notre Dame, Ind.

When warm, sunny days follow frosty spring nights, maple sugar season has come again!

# You'll welcome this real maple sugar flavor

Spring . . . and the flavor of fresh-made maple sugar—how welcome they are after a long, cold winter! And that real maple sugar flavor is captured for you in our Vermont Maid Syrup!

Our skilled blenders select rich, fullbodied maple sugar; then blend it with cane sugar. This gives you, at moderate cost, real maple sugar flavor that is uniformly rich and delicious. Get Vermont Maid Syrup at your gro-

Forest Hills, N.Y.

♠ The entire collection from Vienna's Museum is popularly known as the Hababurg collection, although a few of the works never belonged to the Hababurgs themselves.—ED.

### MYCRO CAMERA

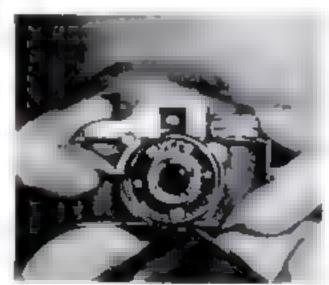

Sirs:

In your "Tiny Cameras" (LIFE, June 20), you stepped—innocently we presume—into the middle of an unfortunate state of confusion about the subministure Mycro camera.

One of the captions in your story refers to "The Myracle Mycro," which "sells for \$12.50." Please be advised that there is no such comerc. We are distribution agents for the exclusive importers of the Mycro camera from the Sanwa Company in Japan, and it sells for \$9.95. The Myracle camera, which sells for \$12.50, takes the same size picture but is manufactured by an entirely different Japanese company.

It is unfortunate that the distributors of the Myracle camera continue to use the trademark "Mycro" as part of their company name; but Ltre's story has confused the mination even more by the use of the hybrid term "Myracle Mycro," which actually describes nothing. The photograph below is a picture of the Mycro camera for which this firm is the exclusive distributor.

JEROME W. COOPER Cooper Photographic Sales Co. San Francisco, Calif.

THE REAL MYCRO

### HEADSTANDER'S PIE

Sire:

I have just read your article showing a man testing the dishes of vorious states (Life, Oct. 24). What are the ingredients of a shoo-fly pie, a regional dish of Pennsylvania?

CLIFFORD H. BISSELL

Berkeley, Calif.

• Molasses, baking soda, brown sugar, flour, shortening, salt and boiling water. According to some folk-lore experts, the term "shoo-fly" comes from the sweet, syrupy substance of the pie, which attracts flies that have to be shooed away.—ED.

Address the Editors at 9 Rockefeller Plaza New York 20, N.Y.

# Here's why so many doctors recommend Denicotea

The harmful effects of nicotine and tars on the human system are of deep concern to the medical profession. Doctors who have tested Denicotea have been quick to recommend it.

Nothing filters like the Denicotea crystal filter. You can see the evidence in the blackened filter, soaked with the harmful residue that otherwise would have entered your mouth, throat, nose and lungs . . .

No matter what cigarette you smoke, Denicotea definitely filters the smoke, cuts down nicotine and tars!

### Used by millions for smoking health and pleasure

If you have sinus trouble, smoker's cough, throat irritation, or have other reasons to cut down on smoking-don't fail to use a Denicotea cigarette holder ...

Many dentists recommend Denicoted to guard teeth and gums against the stains and irritants in tobacco smoke. Your breath is fresher, your mouth feels cleaner, when you use Denicotea!

### Denicotea holder

With polished aluminum ejector and \$200 10 extra futers.

### Lady Denicotes holder

Long, and sism, gold tone ejector. In black or costume colors, 12 filters.

# SPEAKING OF OF PICTURES

FINGERS OVER LENS, a stay but commonpace take, can obscure most of the subject as illustrated choice

STATIC ON NEGATIVE caused by quick winding of fam during on a weather leaves oud patterns

RAINDROPS ON THE LENS sometimes can make a building appear to be on fire (above). If the picture absolutely must be made in the rain, says Feininger, the photog-

rapher should either get himself a lens shade or carry an umbrella. After the mistake has been committed to the negative there is no remedy for it in developing or printing.

# Feininger's book catalogs common mistakes made by photographers

Photographic materials having reached their current state of perfection, most picture mistakes are the picture taker's fault. This is the considered judgment of Ltfr Photographer Andreas Feininger as set down in his new 409-page book called Feininger on Photography (Ziff-Davis, \$15). Knowing that a conscientious photographer benefits from mistakes,

Feininger has for years collected examples of photographic errors, some by himself, some by others. While a few are caused by mechanical defects (above, left), most derive from simple blunders like moving the camera during picture taking (below, left).

the camera during picture taking (below, left).

Feminger's book, the distillation of his 15-odd years' experience as one of the best photographers

alive, covers everything from the rudiments of how to point a camera to the darkroom tricks of a sophisticated photographer (next page). The most complete one-volume work of its kind, it surpasses most other photographic books by showing the worker how he can advance beyond the limits of his technique into the realm of imaginative photography.

CAMERA BEING MOVED while picture is taken generally gives blurred result. To avoid: use a tripod, shoot at a higher shutter speed or learn to hold the camera steady.

LIGHTS SHINING INTO LENS have this effect if the lens has not been coated to prevent light from going astray. To avoid: use lens shade or stand behind large object.

Scientific Research Indicates You Can Help

# Prevent Tooth Decay

With the New Ammoniated **Tooth Powder** 

Colgate's Amazing New Dentifrice Has a Refreshing, Minty Flavor that Leaves **Mouth Sweet and Clean-Tasting for Hours!** 

You, too, will prefer the refreshing minty flavor and foamy cleaning action of this wonderful new dentifrice, made with the amazing formula which, dental science indicates, helps to prevent pain, worry and expense of needless tooth decay!

New Colgate Ammoniated Tooth Powder, created in Colgate-Palmolive-Peet research laboratories, is based on a formula developed by University of Illinois scientists, It contains those wonder-ingredients, Dibasic Ammonium Phosphate and Carbamide, that help many people prevent new cavities. Yet it leaves no unpleasant after-taste.

Start combating tooth decay with Colgate Ammoniated Tooth Powder, Use regularly as directed. Note how good it tastes, how freely it foams, how clean it makes teeth look and feel. Sweetens the breath and refreshes the mouth, too!

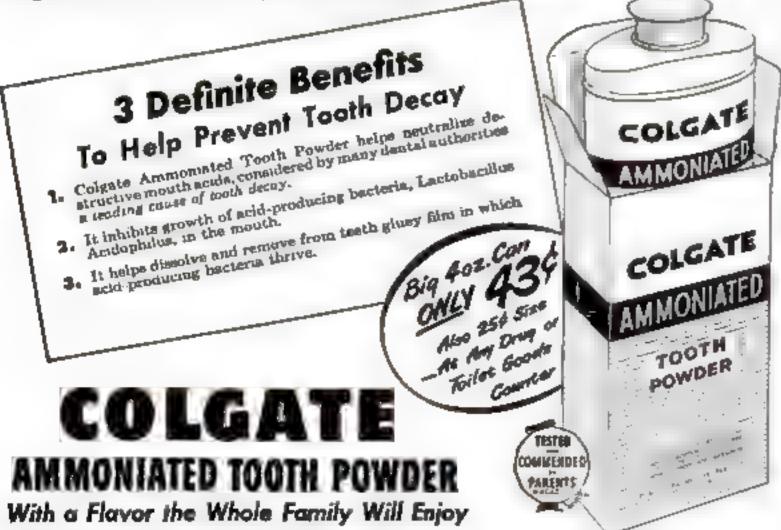

GUARANTEED BY COLGATE\_If you don't agree Colgate Ammoniated Tooth Powder is the finest ammoniated dentifrice you ever used, we guarantee to refund your purchase price in full, plus postage. Just return the unused portion to Colgate-Palmolive-Peet Co., Jersey City 2, N.J.

Help Youngsters avoid tooth decay during growing years, when worst damage occurs, Parents' Magazine has tested and commended Colgate Ammoniated Tooth Powder. Children love its minty flavor.

Dantists Themselves Use and recommend ammonisted dentifrices as an aid in controlling tooth decay. For cavities already formed, and to safeguard mouth health, be mure to visit your dentat regularly.

# LIFE'S REPORTS

CENTER OF RIO'S JAM was the narrow area between the Cardinal's palace and the Gloria Hotel. Here, where the mountains almost meet the bay, through traffic must use either the wide Prais do Flamengo (heavy line) or the narrow Rua do Cattete (thin line) or a tiny cobblestoned street (not shown). Repairs partly blocked Flamengo; a wreck closed Cattete, and traffic, squeezing into the cobblestone alley, met other traffic, backed up and paralyzed all routes.

# MONSTER TRAFFIC JAM

# One little' Rio collision halts 10,000 autos by WILLIAM W. WHITE

Brazilians are a friendly, courteous, thoughtful people—until they get behind the wheel of a car. Once there, however, with a firm grip on the horn, they careen and honk and jockey like drivers in a "hot rod". race. It is debatable whether the motorists of Rio de Janeiro, Buenos Aires or Mexico City are the hemisphere's most madeap, but one would hesitate to bet against motorists who achieved what Rio's did recently: a six-hour traffic jam that paralyzed the city.

This jam began at 8:30 a.m., when a small truck collided with a trolley in front of the Cardinal's palace in downtown Rio. Four and a half

hours later the two vehicles still stood there.

The accident was just one of several dozen that daily clutter Rio's overloaded streets. Each wreck, each broken-down car, creates a traffic problem of its own. Rio's streets are so crowded that when a car in one lane stops it affects all the cars behind it for blocks. The difficulty increases when two cars or a car and a lamppost collide. The high mortality rate of lampposts in fact prompted one Brazilian recently to declare, "Give me the lamppost concession, and you can have the treasury."

# SALON-SAFE FOR HAIR THAT LACKS BODY" SALON-SMART FOR EVERY HEAD

Here's a new, gentler home wave that's safe for even the soft, fine-textured hair that lacks "body"! Yet this home wave is efficient enough to give strong, deep, luxurious waves that really stay in and hold up!

It's the new, improved Richard Hudnut Home Permanent!
With it, you use the same sort of preparations...even the same
improved cold wave process found gentlest and best for waving
thousands of heads in the Richard Hudnut Fifth Avenue Salon!

No fear of harsh frizzed ends...no worry about being able to do a good job. Just follow the crystal clear directions for the most successful home permanent ever.

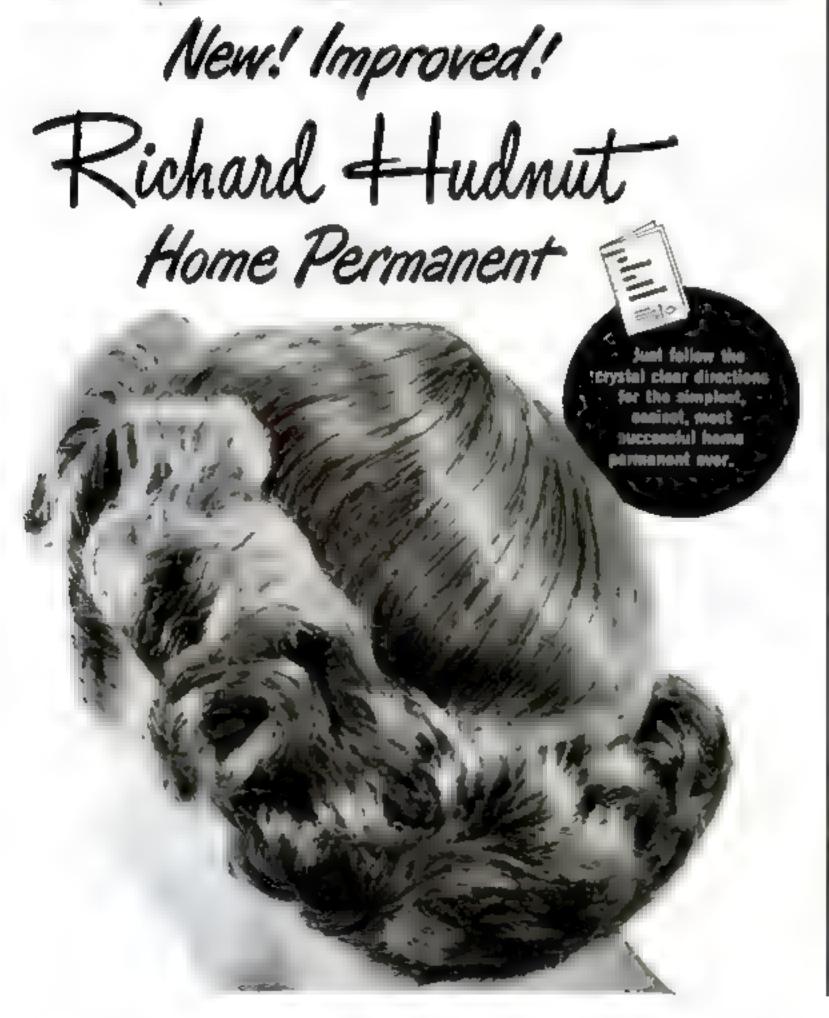

There isn't a more luxurious, softer, more natural-looking home wave for any head! Price, \$2.75; refill without rods, \$1.50. (Prices plus Tax.)

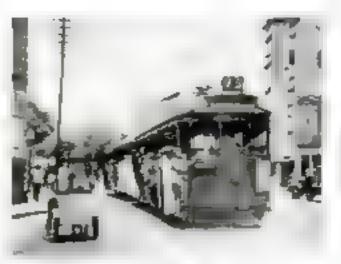

HERE'S WHY USERS PREFER HUDNUT!"

- Gives you the wave you wish you were born with —soft, luxurious, natural-looking.
- 2. Doesn't dry hoir or split ends.
- 3. Fost and easier, too! Special Hudaut presationing makes winding easier; ands less difficult!
- 4. Exactly the type curl you desire tight or loose but never a frizz on the ends!
- 5. Lasts longer—gives weeks more pleasure and prettiness !
- Includes Richard Hudnut Creme Rinse, wonderful for making hair lustrous, soft, more "easy to do."
- 7. More manageable greater conflure variety.
  - As expressed by a cross section of Hudaut Home Permanent users recently surveyed by an independent response organization.

I ented for Advertising by the Journal of the American Medical Association.

a truck, caused the big traffic jam.

### LIFE'S REPORTS CONTINUED

Less than half an hour after the truck-and-trolley collision (a small affair of little damage) Rio was in the toils of the knottiest traffic jam in history. Ten thousand cars were stalled bumper to bumper, and (in some places) nose to nose. Business came to a standstill. Some 200,000 office workers were three to five hours late, and some never got to their offices at all that day.

After one look at the jam many Rio citizens did what came naturally—they went happily down to Copacabana beach. By 9:30 a.m. the palm tree-lined highway along the graceful curve of Praia do Flamengo was a solid mass of cars, 11 abreast, for about 3 miles.

Rio's undisciplined drivers are impatient at the slightest delay. They never wait for a traffic signal to turn green. But they took this gargantuan tangle philosophically, with that good humor for which the Brazilians are noted. The enormity of it indeed seemed to intrigue them, and they behaved with Latin paciencia.

Drivers and passengers got out of their steamy cars and dangled their legs over the sea wall on Guanabara Bay. Jitneys discharged their 10 or 12 passengers for a leg stretch, reloaded when traffic moved forward a few feet. A few chauffeur-driven businessmen read their morning papers thoroughly; when one page was devoured they tore it out and handed it to their neighbors. Cars boiled in the heat. Coffee shops and restaurants along the thronged street were jammed. The restaurant Taberna da Gloria never had such a crowd for lunch. One store pulled two large phonographs outside and filled the exhaust-laden air with Brazilian and American music.

Breycles could get through the jam, but breycle-propelled delivery carts were stalled. A strapping Negro woman, balancing a table on her head, managed to squeeze through some cars, finally stopped when the table got stuck between two taxis. She patiently warted until one driver was able to edge his car over a few inches. The old green open-air bondes (streetcars) were lined up eight deep.

One driver yelled gaily, "Va-

by F. HUGH HERBERT

Creator of "Kiss and Tell", "Sitting Pretty" and "Margie"

I first started recording the teenage adventures of Corliss Archer some six years ago. I already had

plenty of authentic source material, derived from observing my then adolescent daughters Diana and Pamela. I merely had to put into the lips of Corliss some of their more pungent phrases, into the life of Corliss some of their exuberant high spirits, their

natural gaiety, bounce and charm.

Statisticians (who apparently enjoy such computations) have figured that since "Kiss and Tell" opened on Broadway on St. Patrick's Day in 1943, and ran for 993 performances, I have written over 2,000,000 words about Corliss, her life and her family. After "Kiss and Tell," Corlise promptly invaded the radio and the magazines, she made me write a book about her, insisted that she appear in the movies, and even had a skirmish with a comic strip. These same statisticians figure that Corliss has been seen, heard or read about by more than 250,000,000 people in twenty-five countries and fourteen languages. Sounds like a lot of words, and a lot of people - but it would seem to show that Corliss Archer wakes a responsive chord in the hearts of anyone who ever was (or had) a female child.

Now Corliss is back in the movies in a new film "A Kiss for Corliss." This is not a sequel to "Kiss and Tell"; rather it is a projection of continuing events in the hectic life of this ingenious and resourceful young person. And, just as in 1945 Shirley Temple was the only possible choice for the role of Corliss, so now, in 1949, Shirley (who, like Corliss, never seems to grow old) once more plays the lead in "A Kiss for Corliss"—and plays it with the same charm and skill that has endeared the name of Shirley Temple around the world.

PRODUCER COLIN MILLER, F. Hugh Herbert, Shirley (Corliss) Temple and Director Wallace.

### LIFE'S REPORTS CONTINUED

mos tocar as businas" ("Let's all blow our horns"). The playful symphony that followed made Times Square on New Year's Eve seem pastoral. Near the Gloria Hotel an old open black hearse, decorated with the traditional gold lead, waited with patience. Brazilian law requires interment within 24 hours of death, and a driver quipped, "They'll never make it,"

To understand how a collision could paralyze Rio traffic, it is necessary to know something of the physical layout of the city, Rio is built around the entrance to Guanabara Bay. The city's growth to the east is limited by the Atlantic Ocean, to the west by towering hills. (Two of them -Sugar Loaf and Corcovadoare famous.) There is just room in this long, narrow area between the sea and the hills for one main highway between the business district and the residential suburbs at either end. Ninety percent of all the vehicles that ply between those areas must vie for space on the boulevard called Praia de Botafogo. This boulevard channels into the Praia do Flamengo, which in turn leads into the main streets of downtown Rio, Paralleling the Praia do Flamengo is an alternate route -one stretch of it called the Rua do Cattete-which cars occasionally take into the city; but on the morning of the Big Jam thus was blocked by the trolley-track accident. That left nothing open but Flamengo and a little cobblestoned street which parallels the other two.

But one of Flamengo's lanes was under repairs for some distance. So outbound traffic was routed onto the cobblestone street. The open portion of Flamengo was reserved for inbound traffic.

Brazilians, however, are seldom amenable to regimentation. So the outbound motorists began sneaking out of the cobblestoned street onto Flamengo. And at the other end of Flamengo the inbound motorists, stymied by the outbound, usurped the cobblestoned street reserved—in theory—for the outbound. The net result: inbound cars, 11 lanes abreast, ran into a solid surge of outbound traffic.

In view of this monstrous sixhourmuddle, two questions arise: Where were Rio's green-andtan-clad traffic cops? Why hadn't official dom removed the remnants of the trolley-truck wreck and thus opened up the alternate route to town?

As far as the eye could see in this mass mosaic of automobiles, there were only two traffic cops. In true Latin style, they had ac-

IBM products using electronic principles:

Card-programmed Calculator Calculating Punch Statistical Machine Alphabetical Collator **Punched Card Sorter** Electric Time System with Electronic Self-regulation.

IBM's pioneering research and development in the application of the science of electronics to computing machines have added greatly to the reach and scope of man's creative activity.

Through the use of electron tubes such as the one shown above, IBM has produced machines which are hundreds of times faster than calculators based on mechanical principles. Accurate answers to scientific and business prob-Iems involving the most complicated mathematics are being obtained in minutes instead of hours, days instead of months.

Through IBM Electronic Machines, the human mind is finding new release from mathematical drudgery.

### LIFE'S REPORTS CONTINUED

cepted the inevitable and were doing nothing about it.

The wrecked truck was not removed—because of a law. This law requires that all wrecks be examined by a crew of experts before they can be removed. On this particular day it took the experts two hours to arrive at the scene of the wreck. It then took them two and a half hours to make their routine examination of the accident. Rio officialdom had an excuse ready to explain why the experts had not arrived sooner: "They are busy people. They also have to examine safe-cracking jobs,"

The wisdom of this law of the experts is on a par with Brazil's "hit and run" law, which makes it essential for a motorist to flee the scene after he has struck a pedestrian or damaged a vehicle. (Some jitney drivers have this law so firmly impressed on them that they leap out of their cars and run like mad before the dust of an accident has had time to settle.) The motorist has to make off because if he is caught at the scene he will be clapped in jail and held there incommunicado. If he is not caught at the scene within 24 hours, as the law requires, the chances are that he will go free. This remarkable legislation can be blamed on an old law which read that a man could banish a rival by simply swearing that he saw him commit murder. No other "proof" was necessary. In reforming this condition, Brazilians went too far the other way. Now, under the present law, they have to catch the offender in the act, be it murder or bowling over a pedestrian, before they can arrest him.

But the physical layout of Rio, its ineffectual police, its Alice-in-Wonderland traffic laws-and even the little accident that started this grande congestionamento do trafego (as the disgusted morning paper called it) -don't completely explain the thing. What really happened was that finally, and supremely, Brazil's bad-mannered drivers and the automobile age had a fundamental collision.

SOME STREETS in Rio are too narrow for anything except foot traffic.

"If you want the car that gives most for your money, settle on a new Dodge right now."

Harry Grimshaw East Hampton, N. Y.

"Our Dodge is longer inside, but shorter outside - fits our garage with room to spare."

W. J. Adoms West Orange, N. J.

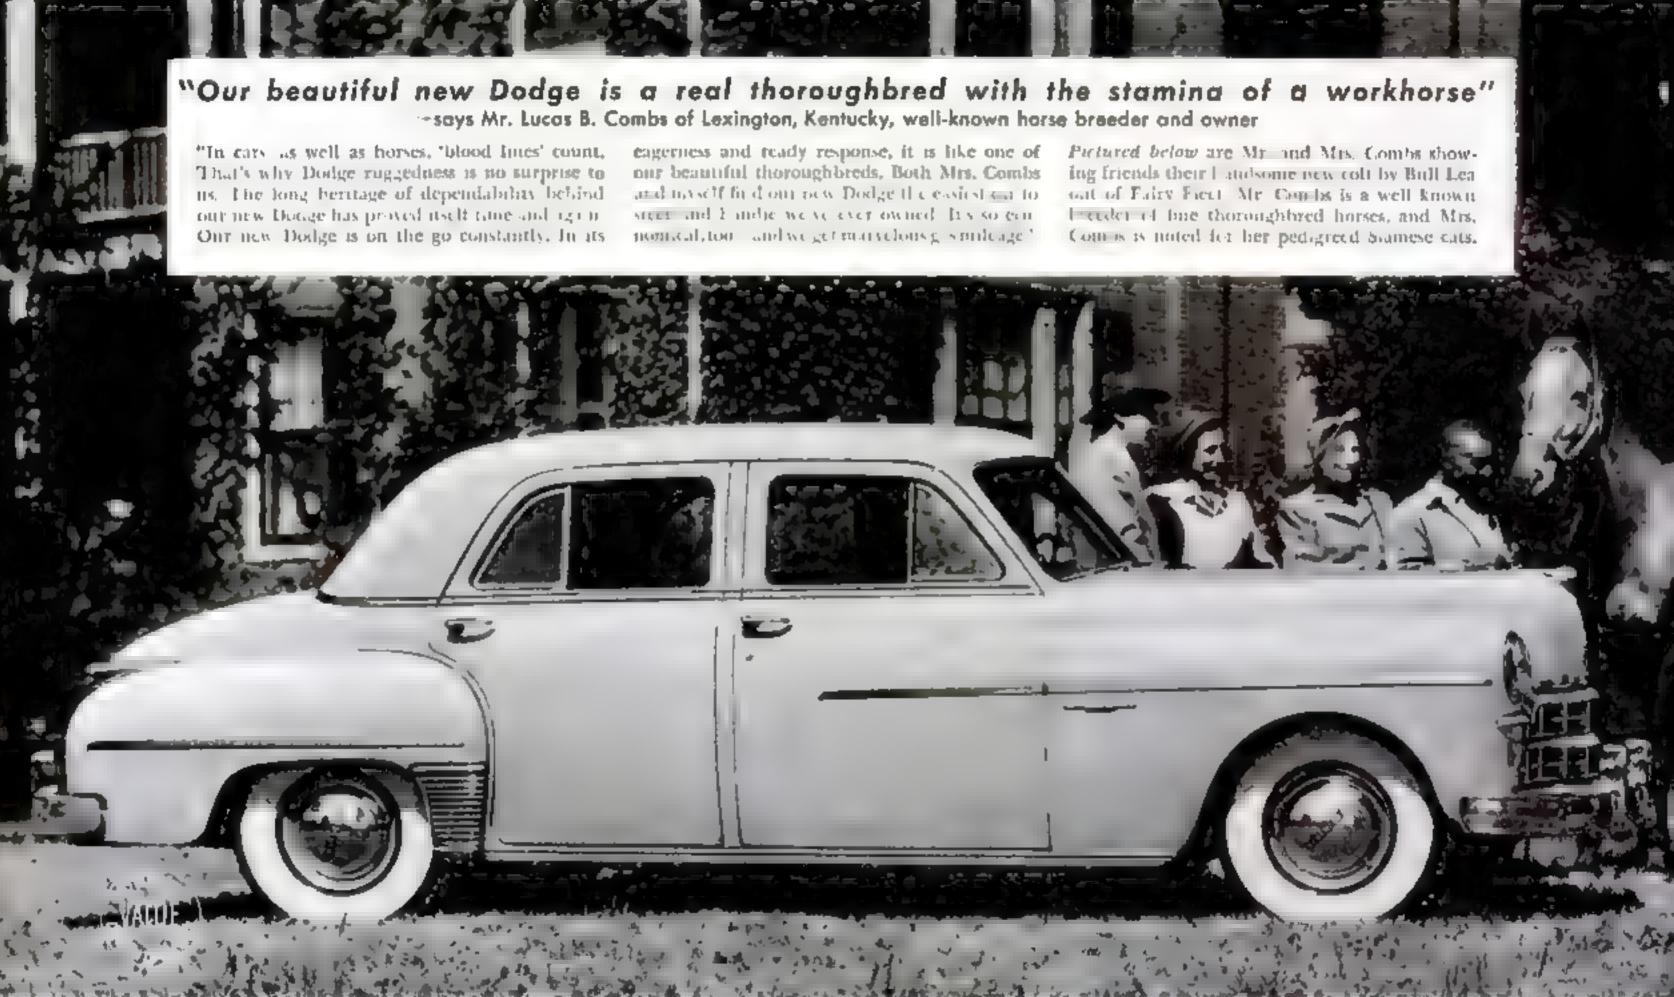

"I like comfort — and Dodge seats are the right shape and height for a relaxing ride."

Elizabeth D. Goumer Wilmington, Del.

"I travel a lot - that's why I go for the huge trunk compartment of my new Dodge."

> Charles B. Hull Grosse Pointe, Mich.

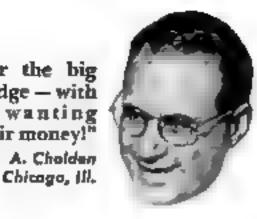

PROOF! More for your money in leg room! Dodge is LONGER on the inside so you can stretch your legs and really relax-not only in the front seat, but in the back seat, too.

PROOF! More for your money in convenience! Dodge doors open wide-so easy to step in or out gracefully. Safety door-checks hold doors open until you close them.

"No wonder the big swing to Dodge - with car buyers wanting more for their money!" A. Cholden

"I could have paid hundreds of dollars more without getting all Dodge gives me!"

Elmer E. Niles Evention, III.

"Anyone who wants the very most for their money should take a look at Dodge!"

Mrs. Oliver Wetteray St. Louis, Mo.

"Our new Dodge is a honey for looks and luxury — a sweetheart for performance, tool"

W. J. Dahl Souttle, Wash,

# BEAUTIFUL...LOW-PRICED! BEAT DODGE FOR VALUE...

# say owners from Coast to Coast!

You could pay a thousand dollars more and still not get all the extra roominess, ease of handling and famous dependability of this beautiful big Dodge

No wonder owners say Dodge is without doubt today's BIGGEST DOLLAR VALUE!

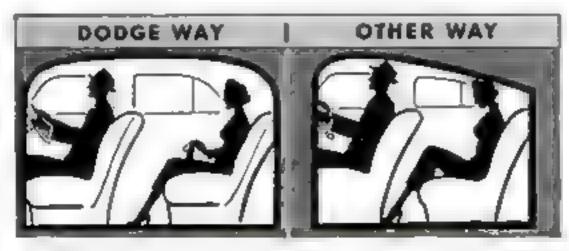

You pay so little extra and get so much more, compared with smaller cars. Model for model, Dodge costs but a little above the lowest-priced cars. And compared with cars costing up to a thousand dollars more, Dodge gives you advantages that can't be matched.

Dodge is HIGHER, WIDER, LONGER on the inside so you can ride in comfort-with the leg room, head room, and elbow room that leaves you fresh and relaxed, even after a long day's trip. Yet the big new

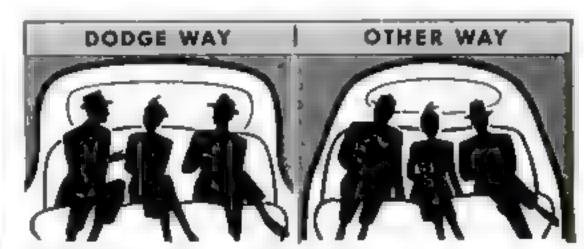

Dodge is actually shorter and narrower on the outside to help in today's heavier traffic, in parking. And Dodge is LOWER for sleek new beauty lines.

You get the flashing performance of the big Dodge "Get-Away" Engine-more powerful-higher in compression. You get famous Dodge dependability to measure your satisfaction in terms of years. You get Dodge economy...low cost of operation.

See and drive today's big low-priced Dodge at your neighborhood dealer's right away. Prove to your full satisfaction that Dodge gives you a far bigger VALUE.

PROOF! More for your money in scating comfort. You don't have to sit almost on the floor in a Dodge. Seats are just the right height for relaxing comfort. They are "knee level" with full leg support. And there's plenty of head room, too.

**PROOF!** More for your money in head room. Dodge is higher and wider on the inside so you can sit in a natural position. No sloping, body-cramping roof lines—no scraping your hat on the roof above or cricking your neck against the side.

The Big Rugged Just a few dollars more than

the lowest-priced cars!

COME PEOPLE who are hard of hearing S heatate to wear a hearing and because they don't want to be conspicuous.

There's good news for those people in the story of a career girl whose Sonotone gives her wonderful, natural hearing, without giving away her secret!

"Nobody Knows I'm Deaf" is the title of her story, a story told in words and pie-

No telltale button in your ear when you went Sonotone's revolutionary OUT-A-SIGHT! No one notices you're wearing a hearing aid, and your braring is so smooth and natural you forget it, too.

SONOTONE, Box 300, Elmsford, N. Y.

### LIFE'S COVER

Bilingual Model Lilban Marcuson is another of Sweden's gifts to LIFE's cover editor although, unlike her predecessors within one year (Ingrid Bergman, Viveca Lindfors, Marta Toren, Haide Göranson), she is one generation removed from Stockholm. The pearls on her hat (Lily Daché, \$55,50) and 11 strands around her throat total 1.782, and are this season's most dramatic illustration of the fashion for wearing pearls by the yard (p. 133). Like diamonds, pearls are a traditional wedding gift for brides, and 20-year-old Miss Marcuson will marry a Trinity College (Conn.) senior on Nov. 22.

The following list, page by page, shows the source from which each picture in this issue was gathered. Where a single page is indebted to several sources, credit is recorded picture by picture (left to right, top to bottom) and line by line (lines separated by dashes) unless otherwise specified.

# How far will he go on his own?

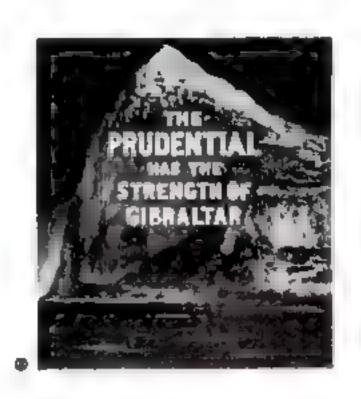

Have you ever thought that when he's bigger ... and could probably win a foot race from you ... he'd still find it hard to get very far in this world strictly on his own?

Yes, he'll need the background of security that only a real home can provide . . . and he'll need an education, a good one.

This is where the Prudential can be of real help. The Prudential has been working with parents for many years, planning with them to make sure that their children will have both security and the opportunity to "go far." Telephone your Prudential representative and ask him to show you the Dollar Guide. With it you can easily figure out for yourself whether there will be enough money to take care of his needs after you're gone. When you've done this, your Prudential representative can show you how to make certain that your whole family's future will be what you want it to be.

Enjoy the Prudential Family Hour of Stars—Sunday afternoons, CBS. And the Jack Berch Show—Every morning, Mondays through Fridays, NBC.

THE FUTURE BELONGS TO THOSE WHO PREPARE FOR IT

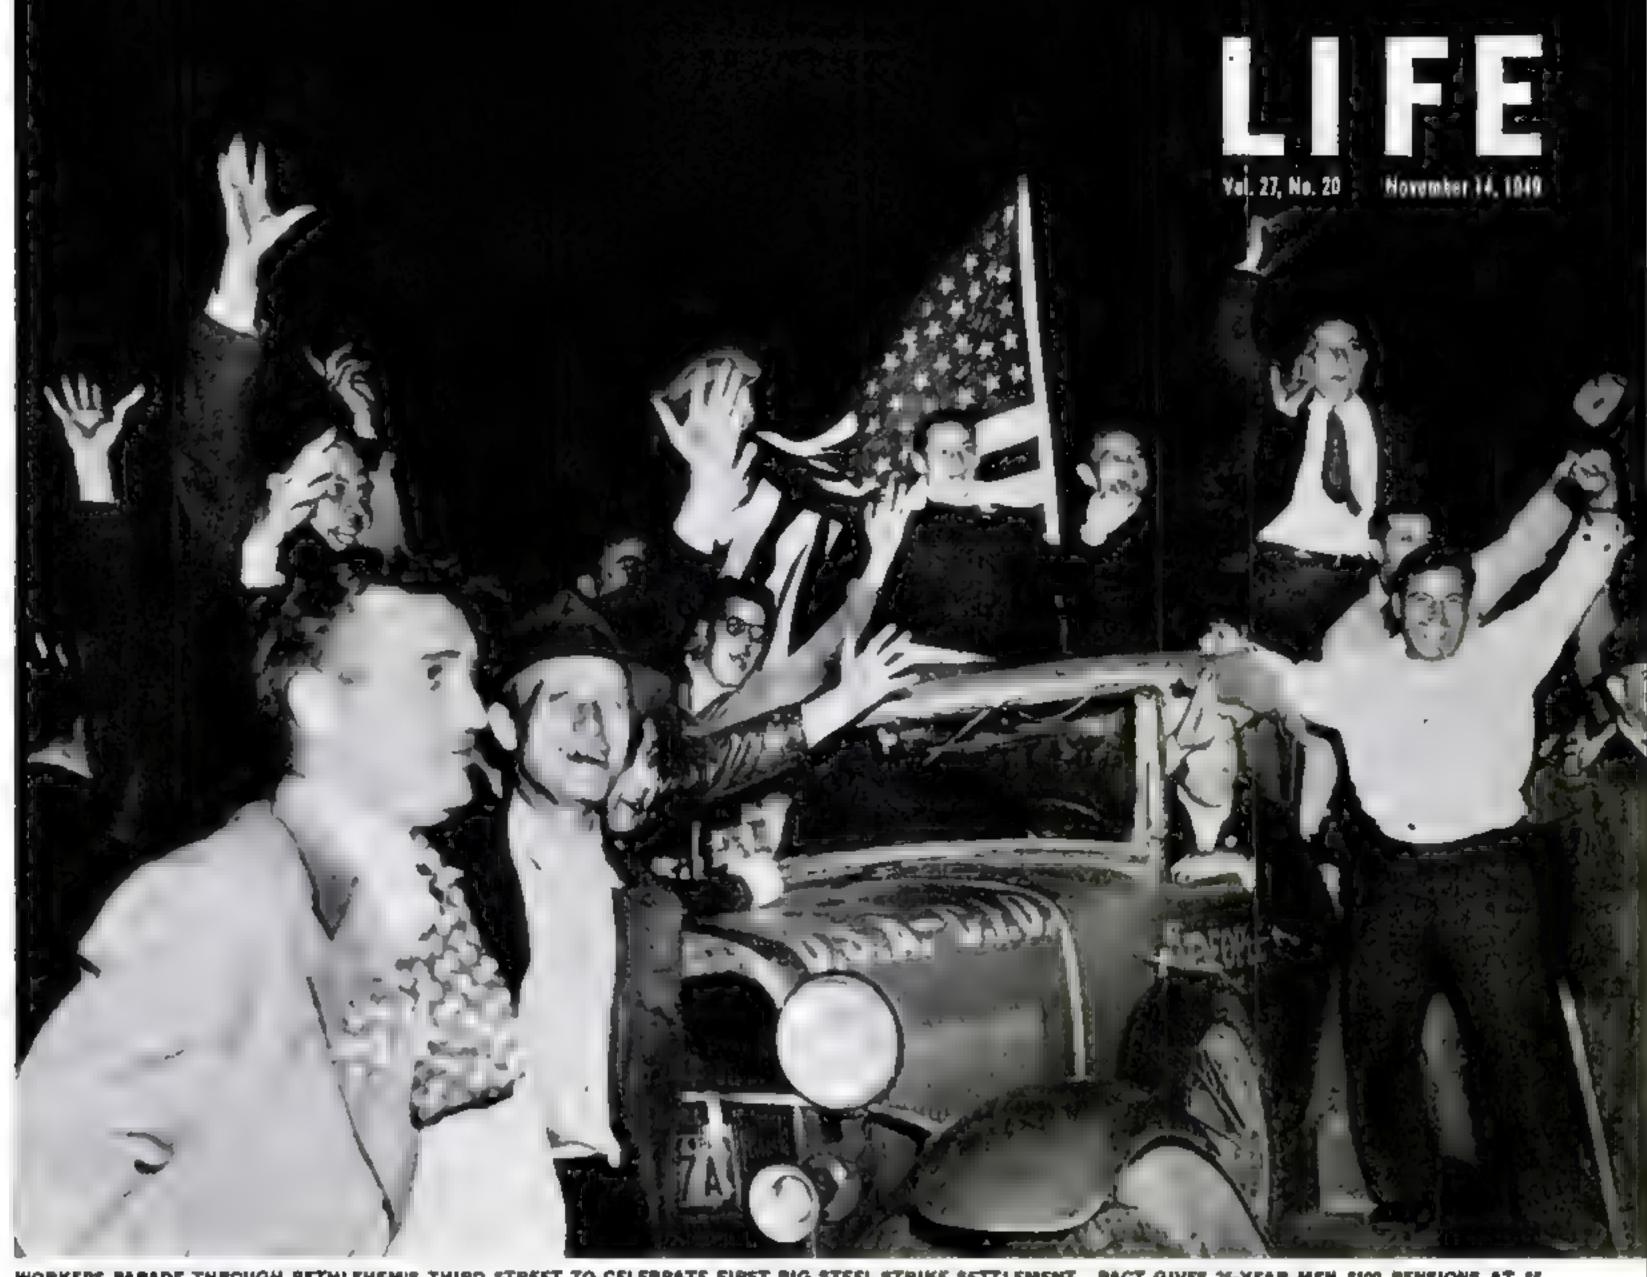

## THE PRUDENTIAL

INSURANCE COMPANY OF AMERICA

A mutual life insurance company

HOME OFFICE: NEWARK, NEW JERSEY WESTERN HOME OFFICE: LOS ANGELES, CALIF.

# PEACE COMES TO BETHLEHEM,

All during the afternoon of Oct. 31 the steel-struck town of Bethlehem, Pa. felt something was up. Telephone operators were putting through hurried calls from local strike headquarters to Phil Murray's hotel suite in Cleveland; bartenders noticed that the boys were having straight shots instead of nickel beers. At 7:30 in the evening pickets at the main gate of the Bethlehem Steel plant broke into a snake dance. Then, as the plant's whistle, a trophy salvaged from the liner Normandie, shricked three times, they piled

their picket signs up and started a bonfire. Then they climbed into cars and paraded down Third Street. It looked like Armistice high jinks after a long, wearying war. And it was. For 80,000 men in the Bethlehem corporation's 11 plants, the great steel strike was over.

It was the start of labor's biggest week since the 1937 sitdowns, Burr-voiced Phil Murray had timed the peace announcement well. The C.I.O.'s convention in Cleveland, where he was ready to crack down on 12 left-wing unions, was getting under way, and the Bethlehem pact set a pattern for other producers (420,000 steelworkers were still on strike). It also improved on recommendations of a fact-finding board. Instead of 10¢ an hour for pensions and insurance, Bethlehem (which already had a pension plan) agreed to pay 11¢, although Murray agreed to a 11/2¢ employe contribution for insurance.

Next day, his prestige enormously enhanced, Murray went to work on the C.I.O.'s Communists. By a 10 to 1 vote delegates gave him what he wanted -a constitutional amendment barring Reds from the C.I.O. executive board.

Then he made an example of the flagrantly party-line United Electrical Workers and Farm Equipment Workers by booting them out of C.I.O. This accomplished, he could smash the leadership of the other 10 unions any time he felt like it. His showdown with the Reds, coupled with the Bethlehem contract, put around the 63year-old Murray's head a halo of labor statesmanship. That would do no harm as the C.I.O. fought to bring the 800,000 members of the 12 rebel unions under a less obnoxious leadership. For Murray it was a famous victory, and for C.I.O. the most important step in its 14-year history.

SMOKE RISES AGAIN in Lehigh Valley from Bethlehem's plant, which dominates lives of city's 70,000 people. In foreground is Lehigh University.

# BETHLEHEM PEACE IS ONLY A PRELUDE TO FACTIONAL WAR WITHIN THE C.I.O.

The first big moment of last week's C.L.O. convention in Cleveland was the authorized the Bethlehem pact (above). The last came when delegates celebrated the re-election of President Murray and his slate of anti-Communist officers with showers of confetti (opposite). There was an unusual an ount of splenetic oratory (p. 48) and conspiratorial whispering. At one time unit is negotiators came from meetings with Republic Steel to conter with Murray on the

NEW LOCAL IS CHARTED in the convention hall corridor as a Chicago delegation, seeking to juin C10's newly formed anti-Communist Fig. trical Workers in cets with

Organization Director Allan Haywood (third from hell). Its assistant R. J. Thomas their center, taking cameric and Jun Carey (at Thomas, etc., the C.) O secretary treasurer.

**NEGOTIATORS CONFER** with Murray (nght foreground) on convention stage about Republic Steel settlement. Man at left was hurt by unidentified thugs four weeks ago.

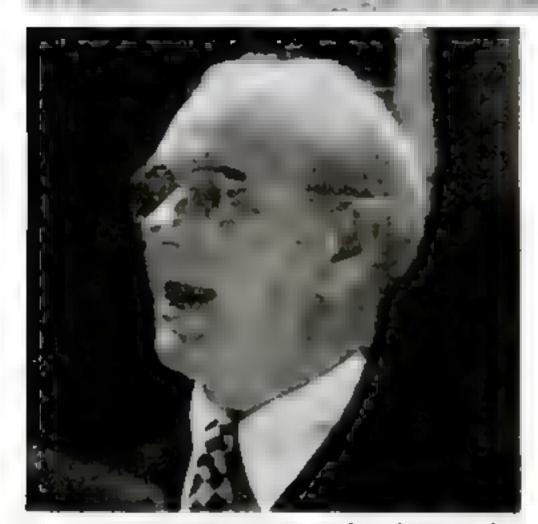

speakers' platform; one new union local was planned in a nearby corridor. While settling its factional problems, the C.I.O. presented an ambiguity of nomenclature to 250 reporters who gave the convention de luxe coverage. Their use of the word "right wing" to describe anti-Communists was misleading; the newstyle C.I.O. leaders are "right" only in relation to Communism. In relation to the U.S. political scene as a whole, they are still left of center—and proud of it.

POLITICAL SPEAKER Murray Lincoln (left), whose address sounded like campaign speech, talks to P.A.C.'s Kroll (right), U A W.'s Reuther. Lincoln may oppose Ohio's Taft.

DELEGATES CELEBRATE with paper dropped from ceiling as N.M.U.'s anti-Communist Joe Curran is renamed C.I.O. vice president. Biggest ovation was given Murray.

PHIL MURRAY: "I have witnessed the diabolical plots against democratic trade unions . . . by several of these left-wing leaders. . . . They are chattels of Sovietism, they are agents of Moscow. . . . What they want is a shambles, a pretense. . . . They dare not stand on their duty feet and give any opposition to anything the Soviets are doing."

JOE CURRAN, N.M.U. president, accused the left of the "lousiest, dirtiest, filthiest slandering" and lit into Harry Bridges, Bridges' arguments, he said, sounded like Vishinsky's—"the only difference is that Vishinsky has better command of the English language. . . . We want [Bridges] to keep his goddamned nose out of our union."

WALTER REUTHER, U.A.W. president: "They are not left-wingers. They are the . . . corrupted left, they are the morally degenerated left. . . . They have scabbed against us on the picket line, they have scabbed against us at the ballot box. . . . You cannot work with people who are . . . devoid of elemental decency and integrity."

HARRY BRIDGES, I.L.W.U. president: "There are four pages . . . in hysterical language setting forth reasons why the union (U.E.) is so-called Communist-dominated. . . . I don't find a single charge that the union has not done a job for its members. . . . The I.L.W.U. has no plans to leave. . . . You're going to have to throw us out."

JOE SELLY, American Communications Association president: "We must not be diverted from our chosen or appointive tasks to the disruptive task of witch-hunting... Why have we spent so much time debating... a little Taft-Hartley Law for our constitution?... we are on the eve of a decision which may spell disaster for the C.L.O."

BEN GOLD, president of the Fur and Leather Workers Union "When I came into this union, I was not hiding that I was a member of the [Communist] party... the doors were opened.... I ask that you reject this un-American, antidemocratic, antilabor rule.... You cannot deprive the numerity of its rights and its expression of opinions."

IN A SEA OF SEATED MEMBERS, THE LEFTISTS STAND UP IN A BLOC TO VOTE "NAY" AS THE C.I.O. MAKES ITS DECISION TO DUST UNITED ELECTRICAL WORKER

A NEW UNION IS CHARTERED as Phil Murray certifies a right-wing version of the United Electrical Workers to C.I.O. Secretary-Treasurer Jim Carey, less than three hours after the expulsion of the old U.E. (opposite). For Carey this was a moment of revenge; he was the old U.E.'s first president, was kicked out of office when party liners seized control of the union in 1941. He now heads a committee of 12 who will run the

new 1 E.'s organizing conference, starting Nov. 28 in Philadelphia, and last week it appeared that he might again become president. The new 1 .E. hopes to take along at least half of the old left-wing union's 400 000 members, including hig locals in Westinghouse and General Electric. But everywhere it faces bitter organizational fights, elections and hearings on plant representation, and court actions over disposition of union treasuries.

### Labor's Big Week CONTINUED

### BUT IT TAKES COAL TO MAKE STEEL

The picture at left shows a \$16 million pile of coal. It belongs to the Consolidated Edison Co. of New York and was stored beside the East River in case of emergency. The picture below shows what has happened to it during the past six weeks. With 380,000 coal miners on strike, Con Edison has depleted its 1.5 million ton reserve by about one third (at the rate of 20,000 tons a day) to generate steam and power for its customers. These pictures dramatize why the U.S. economy last week depended less on Phil Murray than on John L. Lewis. All over the U.S. coal supplies were below the danger point, and even if Murray settled with all steel companies on the Bethlehem formula, full production could hardly be maintained until Lewis sent back his diggers. At week's end Lewis was trying to split the industry by sending out feelers to Midwestern operators. Meanwhile the morale of his miners was diminishing as fast as Consolidated Edison's coal pile. One miner told a reporter, "I'd go back to work tomorrow if I could, but don't you put in the paper who said that. I'd never get work in a mine again."

## LABOR AND SOCIETY

### WITH THE RISE OF WELFARISM, MAYBE THE UNIONS WILL BE THEMSELVES

### BOSCH, BUSH, BING & BING

The unwary reader may be a trifle confused as he proceeds through this issue. On pages 75 through 82 we deal with Hieronymus Bosch, a painter who at the turn of the 15th Century created a wondrous allegory called The Garden of Delights. On pages 112 through 130 we print an article by the scientist, Vannevar Bush, who looks into the undelightful world of the atom. This note is just to reassure all hands that Bosch is not Bush, and vice versa. It's a good thing we have nothing in this issue by LIFE Writer Noel Busch. And just suppose we were reporting this week on the arrival of Rudolph Bing, the European impresario who is to run the Metropolitan Opera Company, BING TAKES OVER METROPOLITAN has already appeared in headlines, doubtless causing millions to assume that the one and only Bing Crosby is broadening his activities.

### DEDUCT ONE CAPITALIST

One of our colleagues has a friend, a rich Wall Streeter, who is forever announcing that some-body ought to do something about the Communists. Outlaw 'em, jail 'em, get 'em out of Washington, send 'em back to Russia, etc. etc. The other day our colleague called upon this vociferous foe of Communism to put up some money for an anti-Communist candidate in a political race that the Communists are going all out to win. The Wall Streeter hemmed, hawed and finally said, "Well, now, I don't know about that. Could I deduct it from my income taxes?" Our colleague gave up. When the Communists take over Wall Street, we'll know why.

### THE WONDERS OF HENRY WALLACE

Seems that a marvelous hybrid chicken, capable of laying eggs in such quantities as to upset all current henyard calculations and to raise hob with federal price-support programs, has been developed by the Wallace family. The family, that is, of Henry Agard Wallace who many years ago revolutionized the corn business with a famous hybrid seed. Here is a fascinating contradiction: Henry Wallace, wallowing in feckless effort to change the social system by political means, works his only revolution with a seed and inspires the start of another via a hy-bred chicken. Moscow ought to make something of this.

There is big news of a big week in Labor. In expelling two of its Communist unions and threatening to kick out the rest, the C.I.O. has done well for itself and for the U.S. In cracking the steel strike and signing up for pensions and insurance, Bethlehem and the steelworkers' union have led the whole of U.S. industry a long way toward the "welfare capitalism" which was discussed and applauded in Life of Sept. 26. With the Bethlehem agreement, the Ford pensions and insurance contract which preceded it, and the many others certain to follow throughout basic industry, the shape of U.S. society is changing. What role, what attitudes may be expected of Labor in the new welfare society? Labor will provide the answers—Labor and the society of which it is a part. All we know is what we hope, and in this editorial we propose only to set out and justify some of our hopes.

First of all, we hope that Labor will get a little better acquainted with itself. Enough so, anyhow, to recognize itself in a mirror. Judging by the demeanor of such moderate leaders as Philip Murray, not to mention the extreme leftists, you would often think that U.S. Labor was something apart from and hostile to U.S. capitalism. Leaving aside the formally anticapitalist fringe, U.S. Labor is a capitalist movement operating within a capitalist society. If you hold that welfarism is good for capitalism, it might even be argued that Mr. Murray is the most useful capitalist functioning just now in the U.S. Who knows? Maybe a bust of him will one day be erected in the lobby of Pittsburgh's supercapitalist Duquesne Club. Yet only the other day, at a strike rally in Bethlehem, Pa., Mr. Murray spoke of "atheistic" communism and remarked that it is "no more menacing in its effect than atheistic capitalism." There was a time, not so long ago, when Labor unions had to fight for their very existence and this attitude was inevitable. Today it makes less and less sense, especially as basic industry gears up to guarantee the welfare of all its workers. Bargaining and the attitudes of bargaining between employers and unions will go on. But in a vast area of industry, Labor is now mature enough, safe enough and strong enough to acknowledge its place within capitalism and abandon the attitudes of conventional hostility which still sour the economic air.

Labor might also improve its sense of humor. A current C.I.O. pamphlet depicts in horrific words and cartoons the growth and might of BIG Business-BIG steel, BIG farmequipment manufacturing, BIG aluminum, even BIG linoleum and BIG breakfast foods. The point of the pamphlet is of course that a few owners and managers arrayed in monolithic might determine the fate of millions of workers, including a scrub lady scrubbing the BIG linoleum in one of the cartoons. We take notice that BIG Steel wasn't big enough to keep Bethlehem from breaking ranks, and that the pioneer pension-insurance contracts recently negotiated have been with BIG Ford, BIG Bethlehem, etc. And what about BIG Labor? The only monolith in the

steel industry today is the United Steelworkers of America, Some of the union's monolithic habits so worried the presidential fact-finding board which set in train the present pension trend that it devoted a section of its report to the subject. What worried the board was the rigid system of industry-wide bargaining which has developed with the big vertical unions in such industries as steel, to the point where "bargaining" for many of the smaller companies has been reduced to a farce. One of the hopeful aspects of the steel situation is that the fixed pattern seems to be breaking up a little. In customary fashion the union has told the bulk of the steel industry that it must grant welfare terms at least as good as those of the Bethlehem contract. But some 50 small companies had already signed on somewhat different terms, and others may be given a chance to show cause why they should not be subjected to the exact conditions of the master agreement. Many of the steel companies now being drawn into welfare programs literally don't know where they are going to get the money to pay the huge costs, and an arbitrary insistence upon universal standards at this stage could wreck their price and profit structures and defeat the union's purposes. So we hope that Labor will recognize the dangers of its own monopolies, and heed the presidential board's advice that vertical bargaining methods in basic industry be re-examined "in the public interest."

Speaking of the public interest, Labor may also be expected to raise its standard of public honor. One may assume that Philip Murray, with his great reputation, sets the highest standard there is. Well, his standard has not been too high in the current tussle. At the crest of his successes it is easily forgotten that the union's contract with U.S. Steel debarred the raising of the pension issue this year, and that because of political pressures within the steel union and C.I.O. Mr. Murray raised it anyhow. His action shook the confidence of steel management in his promises and the effects will be felt for a long while. In swinging the fact-finding board's report at the industry, Mr. Murray grossly overstated some of its findings and ignored those which didn't suit his purposes. Even Harry Truman is said to have been angered by this misuse of the report. "It worked, didn't it?" Sure it did, but when the whole episode is put in its proper perspective the long-term cause and repute of Labor will suffer. Complete mutual confidence between employers and Labor will be essential to the working of a welfare society, and we may reasonably hope that as Labor takes its larger place in that society the occasion for such breaches will vanish.

All in all, the prospects look pretty good. As was pointed out on this page last week the U.S. economy stands to grow enormously within the next 10 years or so. It can take a lot and give a lot. Whether it fulfills its magnificent promise for all Americans depends to some extent upon the attitudes of Labor in the new society. We are betting that Labor comes up to the mark.

remained on river bank, but rest plunged into water and sank. Last bodies were not recovered until after havy crane had raised the wreck

## WORST CRASH IN AVIATION HISTORY

### Fifty-five die as Bolivian P-38 pilot rams Eastern airliner landing at Washington

The big Eastern airliner was about 500 feet off the ground, landing under good conditions at Washington on Nov. 1. Suddenly a P-38 fighter zoomed out of nowhere and rammed the airliner; together the planes crashed into the Potomac. All 55 people in the big plane were killed at once. The P-38 pilot, Erick Rice Bridoux, director of civil aeronautics in Bolivia, who was in the U.S. to study airport administration, was dragged half-dead from the water.

It was the worst plane crash in the history of civil aviation. Only Bridoux, a U.S.-licensed pilot, could explain it-and at week's end he was still alive but no one was able to say whether radio or mechanical failure had caused him to ignore the frantic warnings from the control tower. Among the dead were some well-known people-Representative George Bates of Massachusetts, Helen Hokinson, cartoonist famed for her drawings of blandly purposeful suburban women—and some obscure ones—a 11/2year-old baby, two Puerto Rican nurses. Mrs. Lillie Perkins, a grandmother, had chosen this plane in which to make her first and last flight. Michael Kennedy, former Tammany politician, had a seat on a later plane but suddenly decided to take this one. Some of the dead on Flight 537 had raced to make it; some had delayed. Each had his reason. But no one could look at the quiet gallery of 55 faces without wondering, as Thornton Wilder wondered in The Bridge of San Luis Rey: "Some say that we shall never know and that to the gods we are like the flies that the boys kill on a summer day, and some say, on the contrary, that the very sparrows do not lose a feather that has not been brushed away by the finger of God."

BOLIVIAN PILOT Erick Rios Bridoux, 28, is a national hero, once rescued 117 marooned women and children during a flood in his country. He broke ribs and vertebrae in crash, went into relapse when he heard of the 55 deaths.

HOW BIG IS THE B-36? So big that 89 men can stand on its leel their weight. In Fort Worth last week 88 delegates to the Associated Press Managing Editors' Convention, and Major General Roger Ramey, command-

ing Carswell Field, hard up for a picture on the 230-to-twing of incertale Aar Force's big and controversal ben hirs illuminers at the roughly Coaselianted Vulterplant, which the editors also foured, so i that was not ongo the wing or uld Told 2,500 men averaging 200 pour lisea. ### THOMAS E. DEWEY

### HE IS BECOMING PHOTOGRAPHERS' DELIGHT

Not so long ago it would have been impossible to make the picture above, which was taken last week at a "Youth United" inspirational dinner in Manhattan. Not that its central figure, Governor Thomas E. Dewey, wasn't always a good singer—but for years he had thought it undignified to appear before the cameras with his coat off, let alone sing Sweet Adeline before them. As Life once reported (July 24, 1944), "this ordeal by camera is hard for Dewey. He knows he is difficult to photograph well, and it makes him a restrained and sometimes strained subject. He will allow no gag shots. ...." By last year Dewey had lost enough restraint to be photo-

graphed frolicking with "cavemen" in Oregon. This season, even though he is not running for anything but has merely been helping his friend John Foster Dulles campaign for the Senate, the governor has really loosened up and mastered the delicate art of behaving informally before the press cameras without looking foolish. Now that he isn't a candidate, he makes a more prepossessing picture of a candidate than ever before. Whether Tom Dewey's new-found camera behavior is intended to come in handy in 1952 or not, it is already delighting the news photographers and causing many frustrated Deweyites to wonder why he didn't relax sooner.

HOLDING BABY, the first born at a Long Island housing project, Dewey shows approved technique.

### LIFE CONGRATULATES CONTINUED

THE HAGUE CONFEREES: A bitter four-year-old struggle for independence ended last week in The Hague when Dutch and Indonesians agreed to set up a federal republic of Indonesia by 1950. The Indonesians get sovereignty; the Dutch retain their investments. Merle Cochran (center), U.S. member of U.N.'s Indonesian Commission, patiently brought the two together. With him, from left, are Holland's liberal Dr. J. H. van Royen, Delegate Mohammed Ruem, Premier Anak Agung of East Indonesia and Republican Premier Hatta.

DR. HIDEKI YUKAWA: Last week Dr. Yukawa, a visiting professor at Columbia University, became the first Japanese ever to be awarded a Nobel Prize. He received the physics award (about \$30,000) for his prediction by mathematics in 1935 that the meson is the "glue" in the atom. U.S. atomic thinker Dr. J. Robert Oppenheimer (right) called his discovery "really fructifying."

ARTHUR GODFREY: Briefly last week the maple sugar left his voice while he gave his television studio audience a well-deserved lecture. Interviewing Physicist Wendell Peacock (shown with Godfrey in strip from film recording of program) on the humanitarian uses of atomic energy, he was bothered by

RICHARD RODGERS AND OSCAR HAMMERSTEIN 2ND: Composer Rodgers (center) and Lyriciat Hammerstein (left) took a train to the Ozark city of Springfield, Mo. last week to accept their first honorary degrees (LL.D.) from President James Findlay (right) of Drury College, Proudly music-loving Springfield trotted out its excellent 90-piece Civic Symphony and a 50-voice college chorus to play and sing some of the visitors' hits from South Pacific and Oklahoma! The New Yorkers and Springfielders thought it all just wonderful.

WINSTON CHURCHILL: In London he received the Sunday Times medal and \$2,800 prize for his first two volumes of war memoirs from Lord Kemsley (left). "Writing a book is an adventure," Churchill intoned. "It is a joy and an amusement. Then it becomes a mistress... a master... a tyrant, and ... just as you become reconciled to your servitude, you kill the monster."

chattering, foot-shuffling teen-agers who would have preferred a crooner. Said Godfrey, "I'm not very happy about the reception you folks give to a serious discussion. . . . I'd like to ask that the folks who come . . . to hear the singers wait a few minutes—or there will be no more audiences at these shows."

"Flowers delicious dinner—wonderful

nusic—no trouble getting a sitter for Bobby, Jr. . . . our fifth wedding anniversary is a hoge success, Darling, You can still plan a smooth date!"

"I'm glad you're having such fun, Ann. You deserve it. Let's hope the next fifty years will be as smooth,"

"Any reason why they shouldn't be?"

"Nope . . . not with the plans I've got for a life insurance program."

"But, Bob, that sounds expensive."

"I thought so, too, until I discovered Mutual Life's Insured Income,"

"What in the world-"

"- is Insured Income? It's a method of life insurance planning we can manage within our budget. It will

provide you and Bobby with a regular monthly check if anything happens to me...and, if I'm around later on, there'll be money enough for you and me to enjoy our retirement years together. How does that sound?"

"Like a wonderful anniversary present for both of us!"

Family life is bound to be smoother when the future is carefully planned. Mutual Life's Insured Income program is the sensible way to plan your family's financial security because it builds on assets you already own: pension rights, Social Security benefits, and your present life insurance.

Let the Mutual Life career Field Underwriter in your community explain how Insured Income can help you.

### **PUBLICITY PICTURES**

## THE LADIES AID THEM

In an early issue (Dec. 14, 1936) Life instituted a department called "Released for Publication" to take note of that durable U.S. phenomenon, the publicity picture. These pictures demonstrated the imagination of the publicity man by invariably featuring girls with such incongruous props as boilers, lemons, locomotives and heads of lettuce. This year, however, an element of refinement seems to have crept into the publicity picture. An unaccustomed personality, Eleanor Roosevelt, has been added to the usual catalog of models. Possibly this is a trend.

"LONG OVERDUE FOR A REST" is tribute to Mrs. Roosevelt by Marie Le Doux, who wants to market this chair. Mrs. Roosevelt obliges by resting.

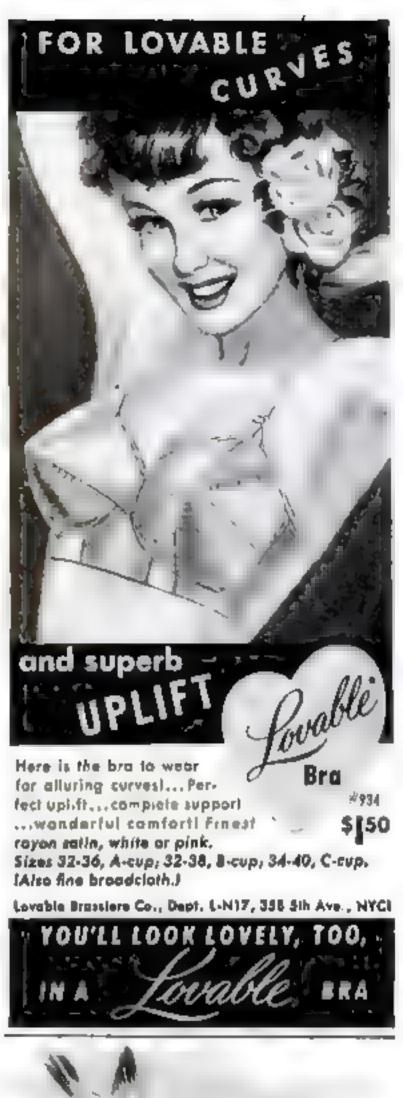

"NATIONAL WALLET QUEEN" Cindy Heller launches National Wallet Week, Her previous titles were: "Miss Bubble Gum," "Miss Coaxial Cable."

"MISS GRILL OF 1949," Barbara Hendricks, publicizes hot-dog cooker.

"PRETTIEST ANKLES" are Betty George's, say Arthur Murray admen.

# The people...

Meat is more than something to eat. It helps you hit the ball harder, run the race faster, do the thing better. It is paint that helps make cheeks rosy. It is fuel for endurance—for nerve—for fun—for strength. It helps the child to grow. It helps the man to work. It helps the woman to be at her best—the wife to have healthy children. It helps the older person to do and keep doing.

Besides contributing to a diet that helps keep bodies strong, the meat industry is the source of dozens of vital medicinal products such as insulin, thyroid and pituitary extract that are essential to saving life, prolonging life and keeping

people healthy. These products are used in diabetes, heart cases, shock, anemia, pregnancy and general surgery.

You have seen the gullied, over-cropped and worn-out fields that dot our countrysides—and you're seeing them brought back to fertility—and producing food at the same time—through new emphasis on livestock raising. Grass roots tie down the soil. Forage crops like clover and alfalfa help restore its fertility.

The experts who calculate America's real wealth know that the only things that count are those that can be put to use by people. We can't eat grass, but meat animals convert the grass from vast range lands of the West into human food. They turn hay crops and feed grains—even waste products like sugar beet pulp—into nourishing meat. If Mother Nature produces more of almost any food crop than people want, livestock can convert that into meat, too.

America's meat needs are served through the teamwork of ranchers and farmers, packers and retailers, backed up by the people who run the trains and trucks, who operate the nation's stockyards—the commission men who sell the farmers' livestock, the meat wholesalers and many others. Through their teamwork meat moves from farm to table at a lower service cost than almost any other food.

HIGH NOON FINDS COLUMNIST RUARK BUSY WAKING UP IN HIS KING-SIZED BED, REACHING FOR A COKE AND THE DAY'S NEWSPAPERS

# Robert Ruark

## Brash country boy makes good as columnist, gets plenty of caviar by Ernest Havemann

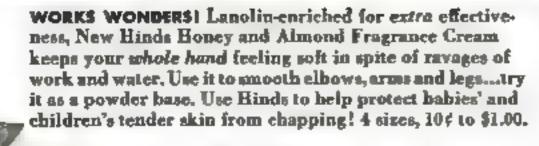

ROARK, the young columnist who is sometimes called the low-brow's Walter Lippmann and sometimes the high-brow's Earl Wilson, is a very enviable fellow indeed. Last month he put out a book called One for the Road (Doubleday & Company, Inc., \$2.50) which, if it duplicates the success of his previous two volumes, will make him somewhere between \$10,000 and \$15,000. The vast majority of people who toil at typewriters would not consider this bad pay for an entire year, but it so happens that to Ruark the money is sheer bonus, or gravy. The book is mostly a scissors, paste pot and rewrite job on the material from his daily columns, for which the Scripps-Howard chain and his other 90 newspapers have already paid him about \$10,000 in the

last 12 months. In addition he will pick up around \$15,000 this year from magazine articles, and perhaps another \$5,000 for such miscellaneous and rather unexacting chores as appearing on the radio and being reprinted in *Reader's Digest*. If Ruark has to report an income of a penny less than \$75,000, plus all out-of-town expenses, he will almost be ashamed to face the taxman next March. The taxman, like Ruark's editors and his readers, has come to expect a great deal from him.

All this financial success sometimes flabbergasts Ruark. At the moment he is just 33 years and 10 months old, and only 12 years removed from a \$12-a-week job as a copy boy. Moreover he comes from a North Carolina family which sank to humble circumstances in the Depression; he had to

ECONOMISTS: An economist is always a planner. He can tell you how to plan anything so it will come out even, and the only trouble is that it never does.

WOMEN: We have made a mistake in treating women like people.

BANKERS: They always act as if you were a mild criminal for needing dough and being willing to pay for the privilege of borrowing a few bucks.

THE MARY MARTIN HAIRIO: I am plumb scared of short-haired women. They generally wind up smoking pipes and quoting Proust at you.

BATTLE OF THE SEXES: Women are physically stronger than draft horses, with steely nerves and limitless endurance. Man, conversely, is a finely wrought creation, sensitive, nervous, prone to hysteria and quick to tire.

FOOTBALL: College gridders are always supposed to be amateurs, even though they make more cash money than the president of the school.

THE PUNCHBOWL: You can't hurt punch. No matter what you put in it, it can't taste any worse than it tasted originally.

#### RUARK CONTINUED

work his way through the state university at various jobs which included a semester of bootlegging gin to wealthier students, and when he applied for his first job he had to be careful how he walked because he did not have a pair of socks on his feet. The prosperous current-day Ruark salts a decent proportion of his income away in annuities and real estate, but he also likes to toss some of it around, as if to prove to himself that it really exists. He enjoys taking his cocktails and dinner at "21," a New York restaurant where the check for two comes to around \$30, plus \$5 for the waiter and an occasional \$5 for the captain—provided of course that you are willing to forego dessert and do not have a hat to check. (Recently he decided to get rid of an inhibition and eat all the caviar he could hold, which came to \$35 worth, plus extras.) When he is home he sleeps in a built-to-order 7x7-foot bed with oversized sheets and blankets. When he travels he likes to go by plane—and whenever possible to have his own Buick, driven ahead by the young man who serves as his factotum, secretary, chauffeur and handyman, waiting at the airport when he swoops down. He carries two \$100 bills in his watch pocket as a form of mad money or emergency fund, lest he be caught short some night in Tim Costello's bar, the subway or a gas station in Texas. Although he still makes a great point of acting like a homespun country boy, given to kidding the rich folks and using "ain't" and double negatives, the fact is that Ruarkin the idiom of his own southland—is eating so high off the hog that the hog can scarcely feel it.

Ruark's chief asset as a columnist, and the thing which causes all these luxuries to fall into his lap, is his ability to discuss topics of the day in funny language. He is a master of the wild simile, the colorful verb and the humorous twist on an old cliché. His daily column, which has grown to a circulation of nearly eight million in less than three years, is written in a deliberately low-down and colloquial language, and in his books, where he can let himself go, he likes to add a liberal sprinkling of cusswords and vulgarity, Yet his buffoonery—like that of burlesque comedians, some of whom are remarkably intelligent men-is an extremely artful thing. He also has a gift for picking out subjects which annoy the common man-women's hairdos, bankers, progressive education, psychiatrists, Texans, doilies, diets, modern art and hot weather-and beating them around the ears in a way that readers love. On occasion he can be a good serious reporter, as when his columns on the sad state of the GIs in Italy under General "Courthouse" Lee made headlines and caused an official investigation in 1947, or when he got gangster Lucky Luciano deported from Cuba the same year. But mostly he is just a funny and sarcastic fellow who surveys the news and foibles of modern civilization and comes to a conclusion which is shared by many millions of his fellow men: "It pains me to admit it, but I guess the whole operation is too rich for a country boy's blood," Everybody feels that way sometimes and a lot of people always feel that way; so the number of Ruark customers is unlimited.

His column, like all good light prose, sounds as if it were abso-

### RUARKISMS

HUNTING: I have never known a hunter—especially a quail shot—who wasn't an outrageous har, a braggart, a pitiful alibier and a neglecter of his job.

TAILCOATS: The only people I ever saw who seemed thoroughly at home in monkey suits were orchestra leaders and the shiny-haired men who dance with old ladies in nightclubs, for money.

SARDINE CANS: Houdini, in his best days, was never able to get into a sardine can without cutting his thumb, spraining his wrist, and wrecking the key.

THE MARTINI: It is a drink unfit for consumption by other than professional sword-swallowers.

FANCY CLOTHES FOR MEN: I can scarcely wait for the day when the male animal finally outrons the female in the glamour league. There I'll be, just as cute as a bug in my silk lounge suit with the red shits in the pockets and a long, scariet, tasseled sash. I will smell sweetly of Unbridled Lust or some such other toilet water. I will cross my velvet mules, run my manicured fingers through my marceled curls, and say, simply: "Get out of here and make me a living, honey. I'm too pretty to work."

lutely no trouble at all to produce. In one way this is true, because the column averages just 650 words and Ruark, being very fast at the typewriter, can turn it out in just half an hour of sitting time. His method of earning a living arouses the antagonism of other writers who put in eight-hour days in newspaper offices or sweat years over unsuccessful novels, and sometimes it seems almost criminal to people who have acquired ulcers owning their own businesses or selling mousetraps. In bars he is frequently troubled by old acquaintances or strangers who approach him, leering as if they knew he had a long police record, and say, "Bob, you old———, I wish I had a racket like yours!"

The word "racket" does not especially bother Ruark. He is an intelligent and realistic young man and he has no compunctions about writing for money; he decided long ago that there was no profit, at least in this world, in starving in a garret and writing pure prose for posterity. Recently, while he was in the process of ordering a Scotch on the rocks at the bar of "21," a stranger standing beside him remarked, "Seems to me I remember a column of yours, a real vicious attack on undiluted drinks like that." Ruark said with charming candor, "Certainly, I'm a very phony type fellow." For the sake of a good funny column Ruark will be happy at any time to be for, or opposed to, almost anything within reason. He has a very good chapter in his new book in which he attacks baseball on the ground that every professional pitcher, far from being a hero and an example to young boys, would gladly dust off his mother to keep down his earned-run average. ("Dusting off" in baseball parlance means throwing one hard and fast at the batter's skull, to teach him proper respect and keep him from feeling too comfortable at plate.) Yet despite the indignant tone of his chapter on ballplayers Ruark would doubtless be glad to dust off any of his female relatives for the sake of a column, or even set fire to them if necessary. His whole career as a columnist has been as carefully contrived as the grand strategy of a great diplomat, containing its full quota of trial balloons, calculated risks and gestures toward public opinion.

#### He makes the old-timers wonder

In his pre-column days Ruark was a top flight newspaperman, the sort of brilliant young cub who makes the older hands wonder why they were ever born. From copy boy on the Washington Daily News he rose rapidly to sportswriter, and then before anybody knew it he had become a kind of one-man sports staff, typing out headlines, rewrites, picture captions, reports on baseball games and a column of his own faster than the eye could follow. During this period, although he hated sports, he became an assiduous student of all the great sportswriters, like Westbrook Pegler and Damon Runyon, and often he did better than the old masters.

On Pearl Harbor Day, when Ruark was 25, he was sitting in the press box covering the Washington Redskins, a professional football team. His office flashed him over the Western Union wire and gave him the job of rounding up all the editors, reporters and linotype

men who were watching the game from various parts of the grandstand. He managed to flush out a crew, rushed back to the office to help get out an extra and went to bed two and one-half days later, knowing that he had been promoted from the sports department into the more serious side of reporting and editing the news of the world. From then on he was top feature writer and assistant city editor for the News.

In this capacity Ruark learned some remarkable skills. The News, which was in the unfortunate position of being only the fourth most prosperous of Washington's four daily newspapers, had to operate on a tight budget. The man who went out on a story had to be able not only to gather the facts and find a telephone but also to dictate a complete, accurate and grammatical story to a typist at the other end of the phone. Ruark got so that he could dictate several thousand words a day under high pressure and make them sound as if they had been carved out by a painstaking craftsman with all the time in the world. He also learned to cover everything from tenement fires to presidential inaugurations and from Saturday night stabbings to Supreme Court decisions. He was brash, ambitious, cocky, fast and good.

By the time Ruark went into the Navy in late 1942 he felt with considerable justification that he could do anything a newspaper required, and do most of it with his left hand. At the same time, however, he began to wonder about the career he had chosen. His maximum salary had been \$80 a week, hardly enough to buy all the caviar a man might crave. Although he had had a good following in Washington, and although his paper was owned by the wealthy Scripps-Howard chain, his work had never come to the serious attention of

#### RUARK CONTINUED

chain executives who were in a position to hand out big money to syndicated writers and pundits. He had once received a telegram from Roy Howard, head of the chain, complimenting him on a feature story he wrote on General Patton early in the war. He had also been told that once on a visit to the News office Howard thumbed through the day's edition, found a half-column cut of the Ruark face decorating a sports column and was moved to ask, "Is this young man as silly as he looks?" (This story is probably apocryphal, the invention of jealous colleagues.) But there was no reason to think that Howard, or anybody else with the power to tap the company treasury, really remembered his name or had any great plans to enrich him.

After three years of serving on convoy ships and Navy public-relations staffs all over the Atlantic and Pacific, Ruark returned to civilian life with a battle plan. He was going to make a splurge, and he was going to do it "by throwing the world's biggest stone at the world's biggest greenhouse." He searched three weeks for the greenhouse and finally found it—American women. "The women had been waiting for the men to get back from the war and the men had been waiting to get back to the women," Ruark explains, "and now romance was sproutin' all over the place. The women especially were feelin' real glamorous—so I figured that the first s.o.b. that came back and sneered at 'em was likely to get some attention."

#### He sneers at women

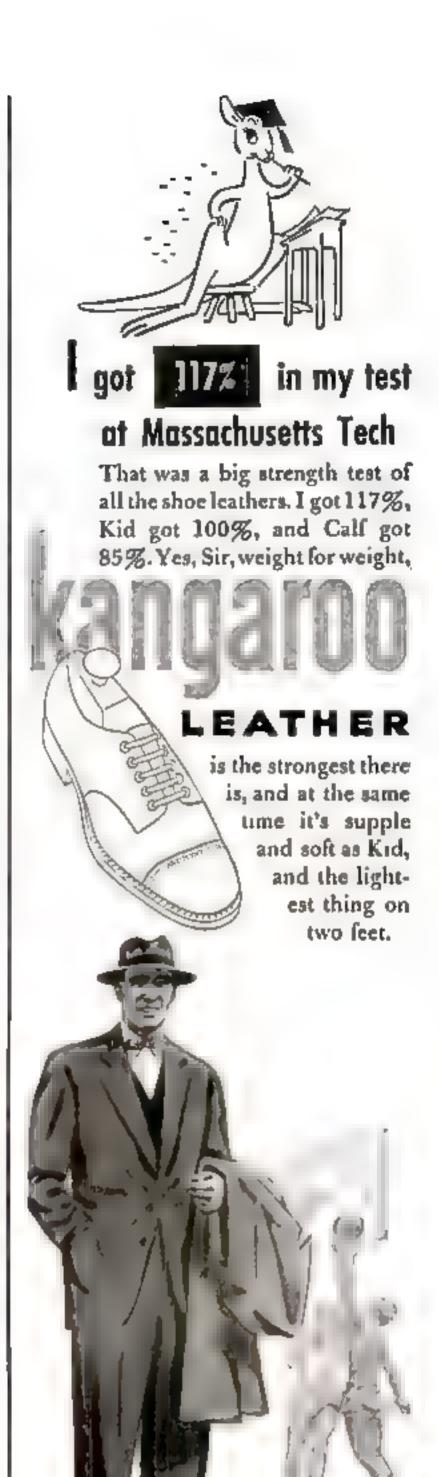

HE sat down and sneered out a story. He claimed that American women in their postwar fashions looked like "something Salvador Dali might muster up after a midnight snack of raw onion and Welsh rabbit." Their hair was "clubbed into a nauseous bundle and hung down the neck like a sackful of mud." They "slopped around in heelless ballet slippers that endowed their walk with all the winsome grace of an Okinawa coolic." Their hats resembled spittoons, ash trays or laundry bundles. They affected "purple lipstick and four-inch fingernails" that were enough to drive a man right back to the foxholes.

Bang went the stone, and the crash of glass could be heard around the country. The American male, who seldom dares raise his own voice in criticism of how his wife or sweetheart decides to display her charms, had found a champion. The girls had found a villain, and yet in their perverse way they seemed to be more titillated than angry. Ruark got 2,500 letters and a telegram from Roy Howard predicting that he would become "God's greatest gift to Scripps-Howard circulation managers." Soon he had his own column and was gaily tossing stones at juke boxes, baseball players, costume jewelry, tailcoats, Scotch on the rocks and any other subject likely to provoke violent argument either pro or con.

"I don't give you any of that 30,000-feet-in-the-air punditing," Ruark explains. "Maybe I'll give you some labor talk on a day when they're picketing the little restaurant across the street from me, or I'll give you sports when I know something about them and a Joe DiMaggio or a World Series is in the news. But mostly I'll give you boys, girls, men, women, dogs, alligators and strip-teasers. After all, you got to remember, what business are you in?—and I figure my primary purpose is to sell some newspapers. Once I heard a kind of a dirty joke about the new French or Bikini bathing suit; I toned it down a little and said the suit looked like it was made from two Band-Aids and a penwiper. I got more letters on that Bikini bathing suit than Lippmann will get all next year."

At the start Ruark believed, as his more envious acquaintances still do, that writing a column was the world's easiest way to earn a lot of money. But as the months have gone by he has learned—as all columnists do sooner or later—that those 650 words a day, day in and day out, eat up a frightening number of subjects, angles and approaches, not to mention similes, metaphors and jokes. He figures that he now works approximately every minute from the time he gets up at noon until he goes to bed at 3 or 4 a.m.—reading the newspapers for ideas, running down news tips, interviewing his subjects, racking his brains, discarding the bad ideas, embellishing the good ones and finally sitting at his typewriter. "That business of writing a column in a half hour sounds good," he complains, "but it's like saying you can have a baby in just a half hour on the delivery table. It's the gestation period that makes your teeth fall out."

A 650-word column five days a week 50 weeks a year adds up to 162,500 words—plus perhaps another 100,000 expended in false starts, columns that turned out to be turkeys and columns rejected by editors. "All those words," Ruark reminds himself, "have got to be pleasin' to Methodists, Baptists, Catholics, Negroes, Jews, Republicans, Democrats, Communists, old people, young people, Westerners, Easterners, Southerners, Texans, male people and female

### RUARK CONTINUED

people. They got to be inspirational, educational, sarcastic, funny, serious and full of zip. And they got to get past editors who might have mortgages, ulcers, wives, labor trouble, sick children, parking tickets and an overdraft at the bank."

When he is on the road Ruark figures that he works a 60-hour week—at such chores as catching planes, sending out laundry, riding taxis, packing, unpacking, finding hotel rooms, dining with his editors, getting passports, passing through customs and exchanging his money in the black market—before he can ever get around to the business of researching and writing his column. He also complains that modern society places a terrific burden on the columnist's pocketbook and digestive system. ("When you meet somebody you have to meet him at a ginmill. Where else can you go?") Sometimes he gets to feeling real sorry for himself and wishes he were in what he calls the "cosmic column dodge." ("There you can write about the atom on Monday, the cold war on Tuesday and the

Sometimes he gets to feeling real sorry for himself and wishes he were in what he calls the "cosmic column dodge." ("There you can write about the atom on Monday, the cold war on Tuesday and the British pound on Wednesday, and then start over again.") Or even sports. ("You can give 'em DiMaggio until it runs out of their ears.") As it is he has to try to stay right behind the news, picking out subjects which are of current interest all over the country and amplifying or finding a trick angle on them. Some of his best columns, reprinted in his new book in revised and updated form, were on the Lana Turner wedding, Tallulah Bankhead's suit against the Prell shampoo radio commercial, Mae West's comeback in Diamond Lil

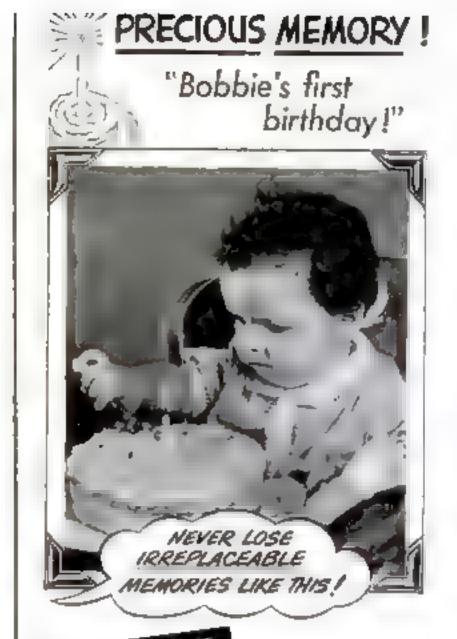

shampoo radio commercial, Mae West's comeback in *Diamond Lil* and the election of Harry Truman—on which he made a lot more sense than some of the more sententious commentators.

The strain of finding timely topics and dressing them up in the trick verbs, conceits and figures of speech that make up the Ruark style sometimes gets almost inhuman. It is a great tribute to Ruark's energy and imagination that he can be so consistently amusing to so many people day after day—and even six months later in a book -or, as a matter of fact, that he can find 250 subjects a year without resorting to such whipping boys as Lippmann's atoms or Pegler's unions. He earns the caviar, the oversized bed and the \$100 bills, and he knows it. Indeed he has worked up quite a lecture for the jealous people who accost him in barrooms. "Naturally there are days when the piece is no damn good and you know it," he says by way of a disarming gambit; "but it's the best no-good piece you could write that day. If you're a columnist who wants to be entertaining, what are you supposed to do in a week when the news is nothing but a coal strike, a steel strike and a Senate hearing on the excess-profits tax?" Then-likely as not while reaching for another Scotch on the rocks and speculating with half his mind whether the undiluted drink is ripe for another tirade—he warms to his subject and adds, "Or what do you do on a day when you've got a terrible hangover, no ideas, a three-hour editorial conference, a bad cold, you mislay your notes, three of the leads you're following blow up, it's raining outside, you can't get a cab, the dog has to be taken to the veterinarian, the mortgage is due, the baby's crying and your wife breaks a leg?"

This lecture is delivered with such sincerity and pathos that it melts all but the most stonyhearted critics. An acquaintance who heard it recently said, "I almost went home in tears and figured I ought to write a letter to Bob's boss or something. It wasn't until next day I happened to think that Bob hasn't got a mortgage, hasn't got a baby and his wife never broke a leg in her life. For all I know, the lucky devil never even had to take his dog to the vet."

AT COSTELLO'S BAR, a favorite hangout in New York, Ruark trades philosophical profundities with Owners Joe (tending bar) and Tim Costello (right).

### Plant Hormones CONTINUED

PLANT BEHAVIOR, which has long mystified scientists by its suggestion of intelligence, can now be explained as simple mechanical reaction. The tendency of a seedling to turn and grow upward when held horizontal (shown in multiple-exposure photograph at top) is caused by the settling of growth hormone into underside of the stem which makes underside grow faster and the stem bend vertically. The plant bends toward light (above) because light destroys growth hormone in the side nearest it so that the plant's far sides grow faster. Only the growing parts of a plant can react to gravity or light. The other parts are fixed.

PLANTS TAKE ROOT (right) after the bases of the stems have been treated with growth hormone. The untreated camellia cuttings (left) develop no roots.

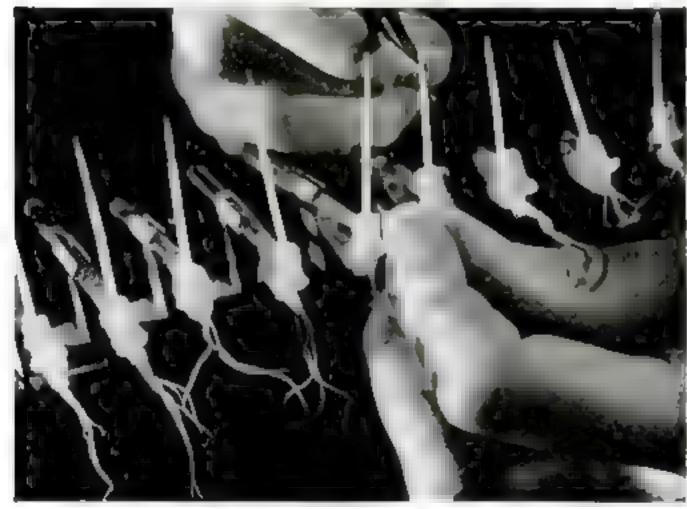

#### Plant Hormones CONTRIBUED

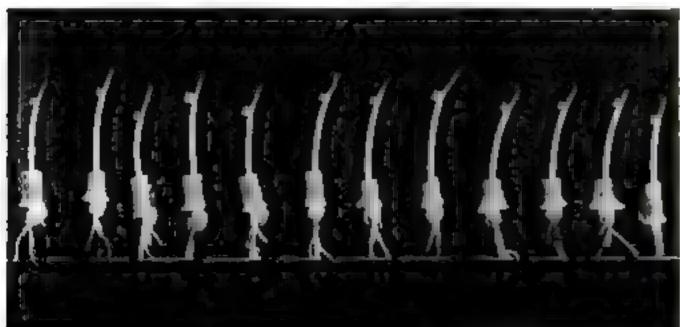

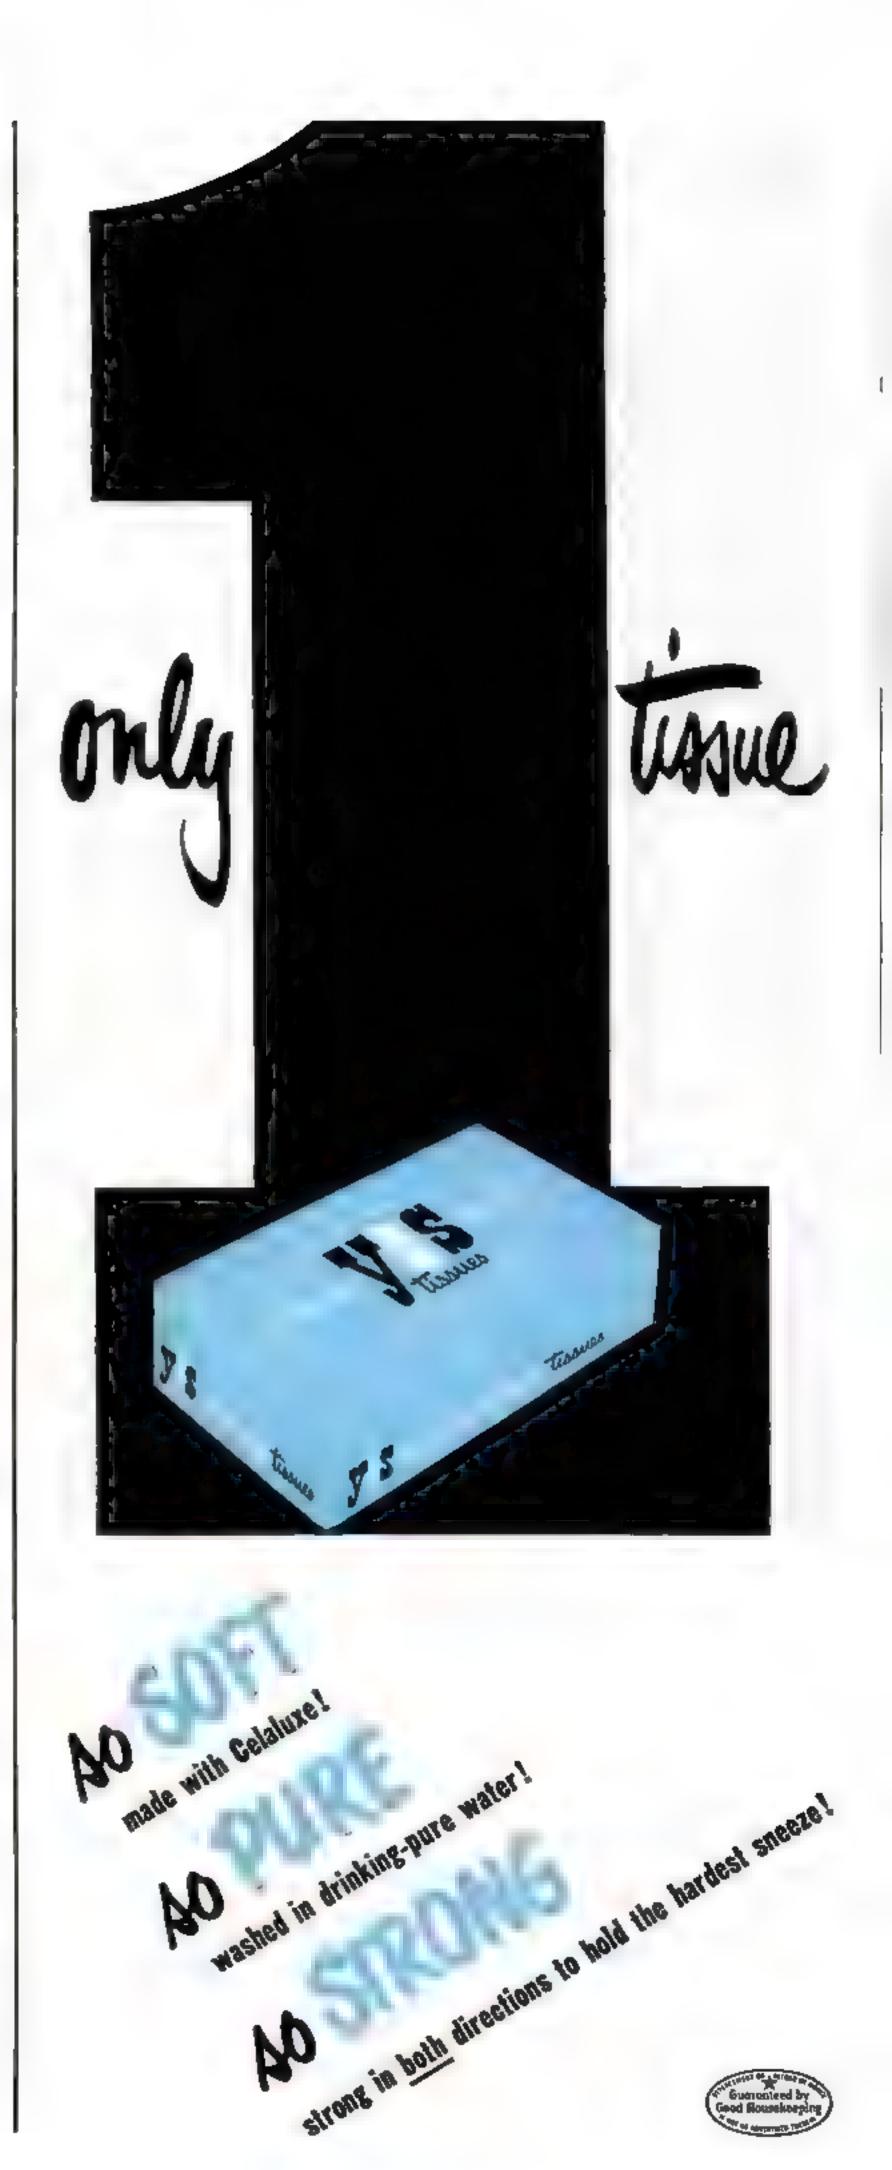

PEA TEST measures effectiveness of hormone solution. Pea seedlings, decapitated to eliminate the natural flow of hormone from their tips, are split down the middle and placed in dishes containing water (left) and hormone solution (right). Seedlings in the water remain unchanged, but after a few hours those in the hormone solution bend inward. Hending occurs because hormone acts only on the undamaged outer surface of stem, causing outside to grow faster.

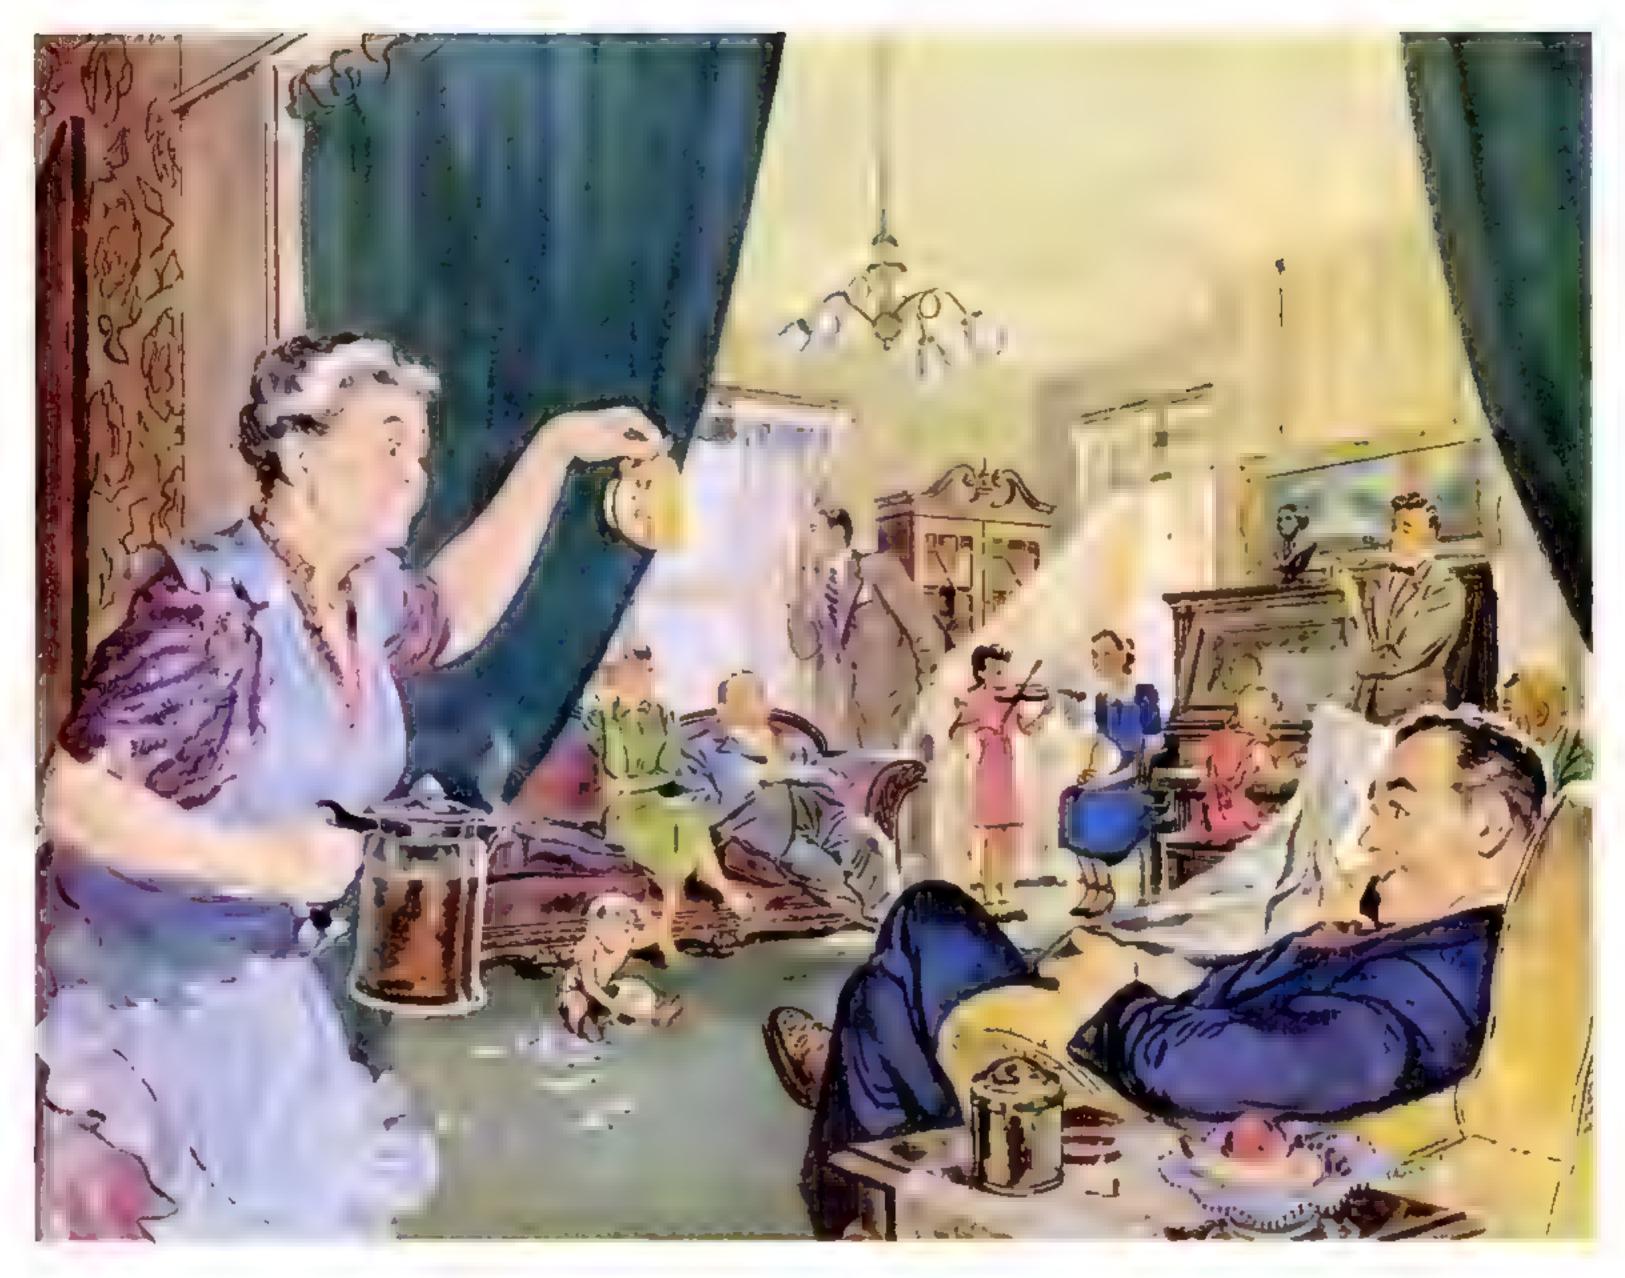

OAT TEST is also used to measure potency of synthetic growth hormone. Oat seedlings, growing in nutrient solution in individual glass tubes, are deprived of their hormone-producing tips so that they can no longer grow (top). Then the core of the stalk is pulled out with tweezers (center), and a tiny block of agar containing a known amount of growth hormone is attached so that it rests between the cut surface and pulled-up core. The hormone in agar block promotes growth only in the side of the stem to which it is attached. Therefore the stems curve (bottom), and the amount of the curve indicates the hormone's potency.

RUNNER GETS TORCH FROM GENERAL MARK CLARK

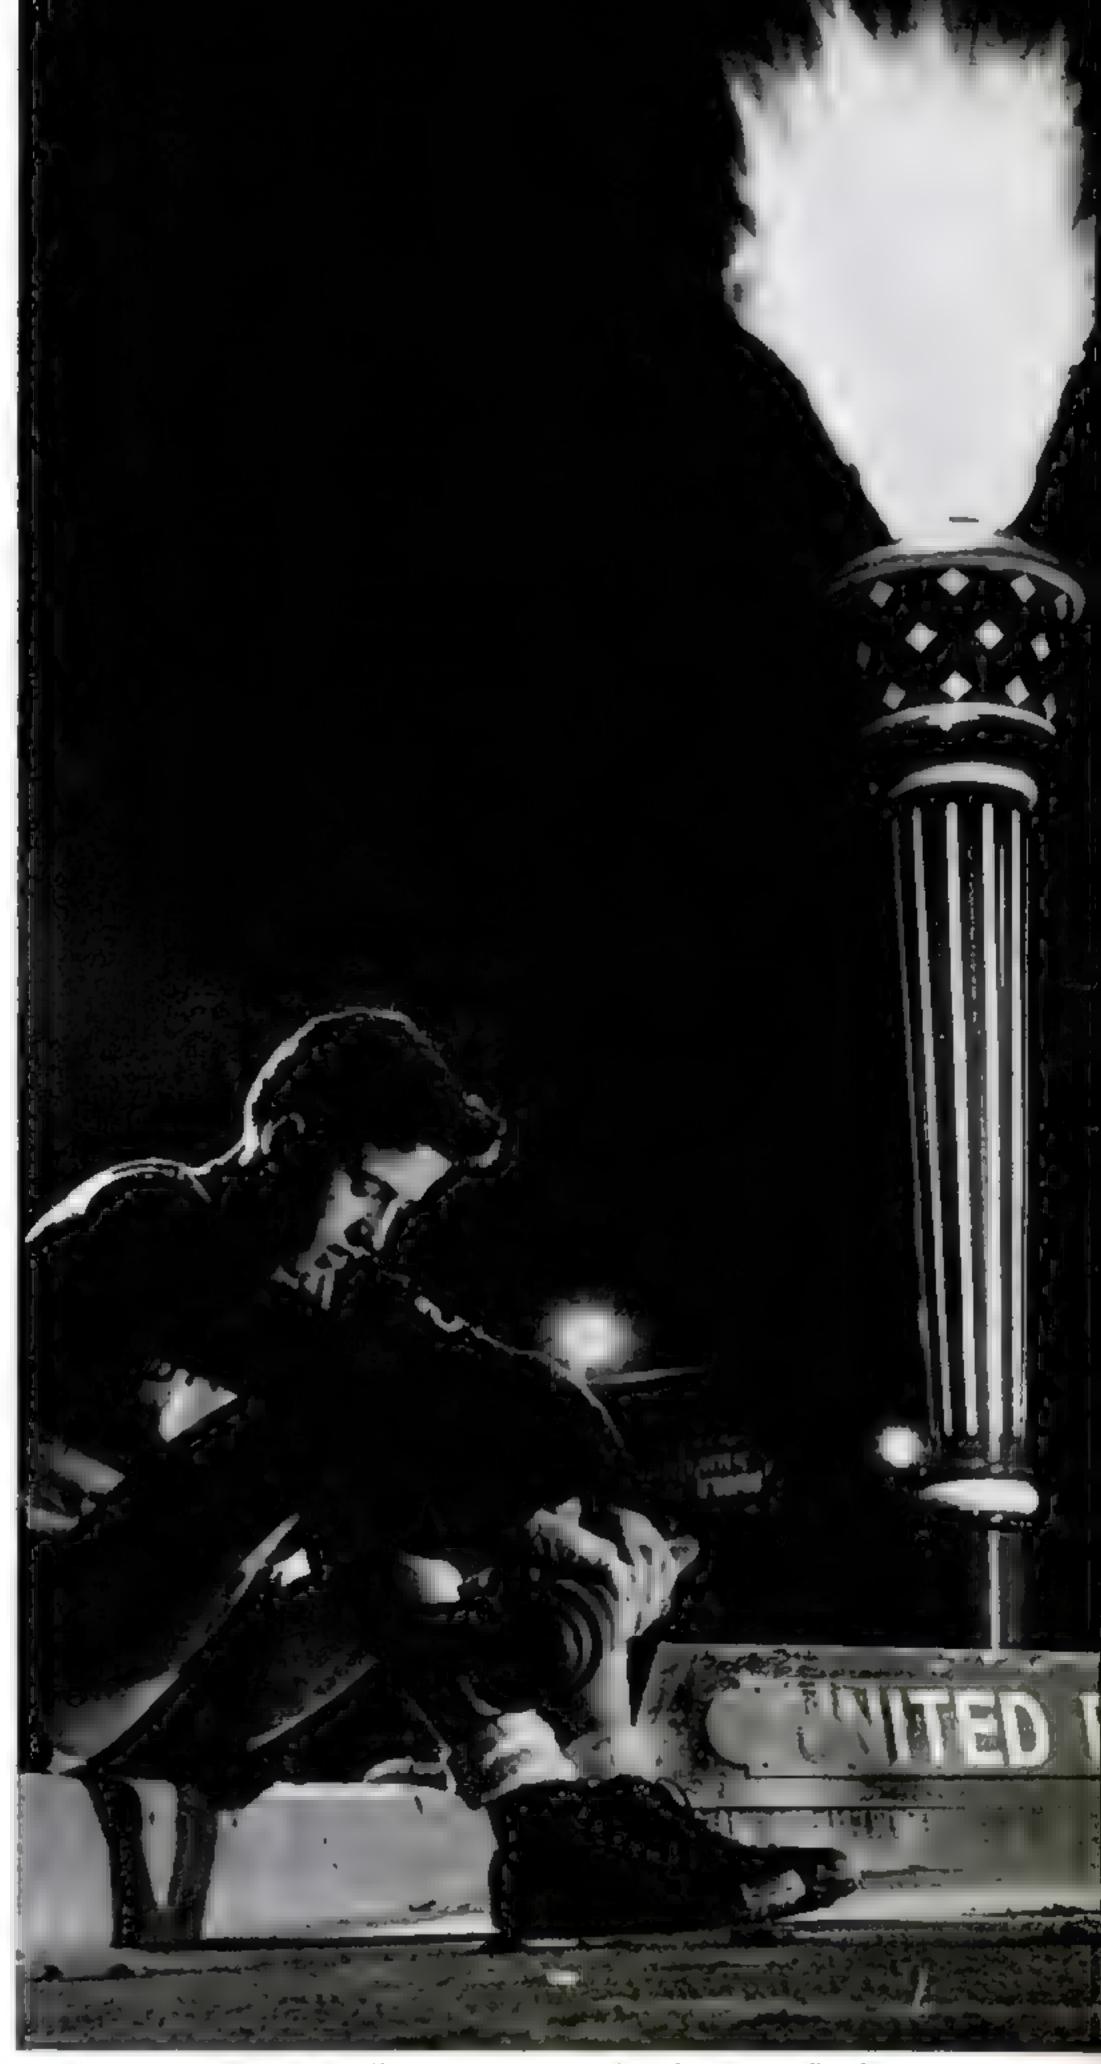

## DETROIT'S TORCH LIGHTS THE WAY

## U.S. charities seek \$185 million

As October ended, Hallowe'en kids on the front porch saying "Trick or treat" made only a faint sound compared to the great concerto for 41 million doorbells, played across the land by almost two million Community Chest workers, collecting money from neighbors to help other neighbors. In some areas the drive had not yet begun; in others it was finished, with early reports indicating that over-all receipts would run close to a hoped-for \$185 million. (Record: \$221,272,950 in 1945.)

Because Community Chest represents a union of charities-and hence relief from year-round solicitation—the idea has spread to 1,250 towns and cities since the first federated fund was raised in Cleveland in 1913. With one gift a donor aids everything from his local hospital to the Girl Scouts. But in many cities even this consolidation has proved insufficient. Last year in Detroit there were no fewer than 50 charity drives in addition to the Community Chest. This year Detroiters reconsolidated with a will. They lumped together all of the Chest's 125 component agencies, plus 18 others, as beneficiaries of a single United Foundation "Torch" Drive. On the night of Oct. 18, while a huge torch blazed before the city hall (opposite page), and while General Mark Clark (above) passed smaller torches to runners who carried them to the suburbs, the drive began. Even the Red Cross, which has traditionally remained aloof from united campaigns, joined in. By Nov. 1, midpoint in the drive, 52.3% of the goal of \$8,550,000 had been collected.

Whether and how soon other big cities would follow Detroit's example was still undecided. The top officers of the Red Cross were scheduled to meet with their new boss, General George Marshall, on Nov. 12 to determine whether to join other united drives. But for the average American among the 20 million who contribute to the drives, further consolidation seemed apart from the real business now at hand. In the big doorbell concerto everyone discovered again that it was very pleasant to say "Hello" and "Thank you" to his neighbors.

HIS MISSION ACCOMPLISHED and historchout, runner in suburban Dearborn pants beside torch which

will burn during drive Because of long distances, runners began and finished on foot, covered most ground in cars.

Psychic Sid, Psychiatrist, was feeling none too fit;

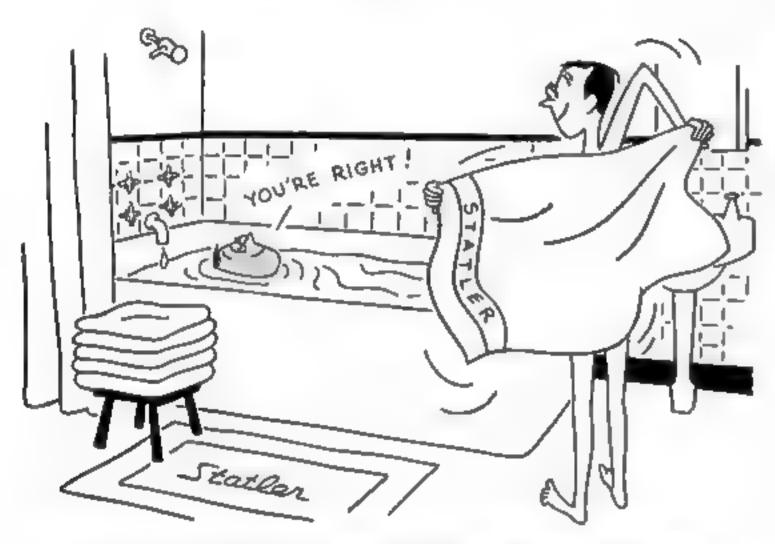

His overwork had caused his personality to split!

"I am two people," Sidney said. "We'll both go take a rest

At friendly Hotel Statler, where you really are a guest.

2. "I really want a good night's sleep," the Psychic Sidney said.
"My bad half, psychologically, is just opposed to bed."
"Not Statler beds!" the bad half cried, "I'm not that silly, Doc.
Eight hundred springs and more will help us both sleep round the clock."

3. "The worried mind," Sid smiled, "will find the Statler bath a spot
For healing relaxation in a tub of water bot,
With snowy towels, piles of soap, the dark soon turns to light!"
His naughty self shd in the tub and whispered: "Doc, you're right!"

Their dinner at the Statler proved a psychiatric hit.

"With food as good as this," he cried, "I simply can't be split."

The bad half shook Sid's hand and said: "You win, and I'm not yelping,
But—could we celebrate your cure and have a second helping?"

No longer split, the happy Sid was cured of his fixation.
But as he left, he paused to cheer the Statler's swell location.
"You're really in the heart of town, you're close to shows and shops.
No wonder Hotel Statler's where the knowing traveler stops!"

CLOSED OUTER PANELS OF TRIPTYCH SHOW THE CREATION OF THE WORLD

## HIERONYMUS BOSCH'S

## Garden of Delights

Scholar offers a solution to painting which has baffled world since 1500

Between 1490 and 1516 in the Flemish town of 'sHertogenbosch, a wrinkled and ascetic-looking Dutchman, Hieronymus Bosch, completed one of the most extraordinary paintings ever produced. It was *The Garden of Delights*, a grotesque, folding triptych whose three panels crawl with repules, towering nightmanish edifices and thousands of little naked people reveling in the sins of

the flesh. Far stranger even than today's surrealist shockers, the meaning of this baffling work—like several others by Bosch—has constantly defied the art scholars, who have had little to go on. Almost nothing definite is known of Bosch's life—only that for a while he belonged to a local religious order and died in 1516. Some scholars believe he was a revolutionary satirist; others that he was a heretic; still others that he was a misogynist who found neurotic pleasure in painting scenes of vice. Two years ago a young New York scholar, Nicolas Calas, set out to solve the mystery of Bosch. After 17 months of study Calas was sure he had discovered the key in two ancient interpre-

tations of the Bible written by two of the great fathers of the Church and widely read during the Middle Ages. One was St. Augustine's commentaries on the Book of Psalms; the other was the commentaries on the Book of Job written by St. Gregory. Far from being surrealist, as it has often been described, The Garden of Delights follows the commentaries in explicit detail. On these pages Calas' explanation, to appear in a book next spring published by Harper & Bros., is presented for the first time.

The over-all theme of Bosch's triptych, says Calas, comes from Augustine's interpretation of an early version of Psalm 33 which describes the Creation and warns of a hornble end for the ungodly. When the wings of the triptych are shut (above), the Creation is revealed in a globe, as Psalm 33 indicates, with the first signs of life sprouting from the earth. When opened, the triptych reveals the scenes on the following pages. Their meaning, as expounded by Calas, is involved and fascinating. However interpreted, the paintings rank with the greatest ever done in the Western world.

BOSCH'S SELF-PORTRAIT

### THE TRIPTYCH UNFOLDED

Opened, Bosch's triptych reveals the sinful delights and the appailing doom of the ungodly, as prophesied in the version of the 33rd Psalm used by Augustine. Virtually every figure and object Bosch has painted has a meaning which Calas has traced to the commentators. For example, the left panel portrays a scene in the Garden of Eden six days after the Creation and just after Adam and Eve (foreground) have committed the first sin. An owl, symbol of night and death in Augustine's commentaries, scowls darkly from a hole in the fountain of life and portends the fate of sinners. Behind Adam, Bosch placed a tree whose trunk is covered with coins to illustrate St. Gregory's interpretation of a passage from Job, that

Adam and Eve stands Christ in a dual attitude of mercy and anger. He shows His mercy by placing His right foot under Adam's to prevent him from slipping down the bank into the filth of the pit at lower right. By looking away from them He shows that He might punish them for their sin. But, as Augustine wrote in his comments on Psalm 33, "there is a seeing of Him that hath mercy, a not seeing of Him that punisheth." Overconfident of God's mercy, Adam and Eve slipped, fell and were punished.

In the center panel Bosch portrayed the complete degeneration of mankind. Once again he drew from the writings of Augustine, Commenting

on the beginning of Psalm 33, "Rejoice in the Lord," Augustine wrote, "Let the unrighteous rejoice in this world—the ungodly are more pleased with pantomime than with God." So Bosch painted his sinners cavorting in a lustful and oppressive silence—in fact, few of his figures are shown talking and these are whispering. In the background four mountainous structures symbolize the four cardinal points of the compass, whose first letters in Greek spell out Adam's name. Since Adam committed the original sin, this casts an evil aura over the whole tableau. In the center, circling a pool full of prostitutes, there appears a fantastic cavalcade of riders who represent the worst sins of man, while in the foreground there is still another colony of lecherous revelers. In the lower left he included two amorous hypocrites seated in a bubble which is wrapped in a spider's

web. This detail was inspired by Gregory's commentaries on the Book of Job, that hypocrites shall perish like a spider's web in the wind.

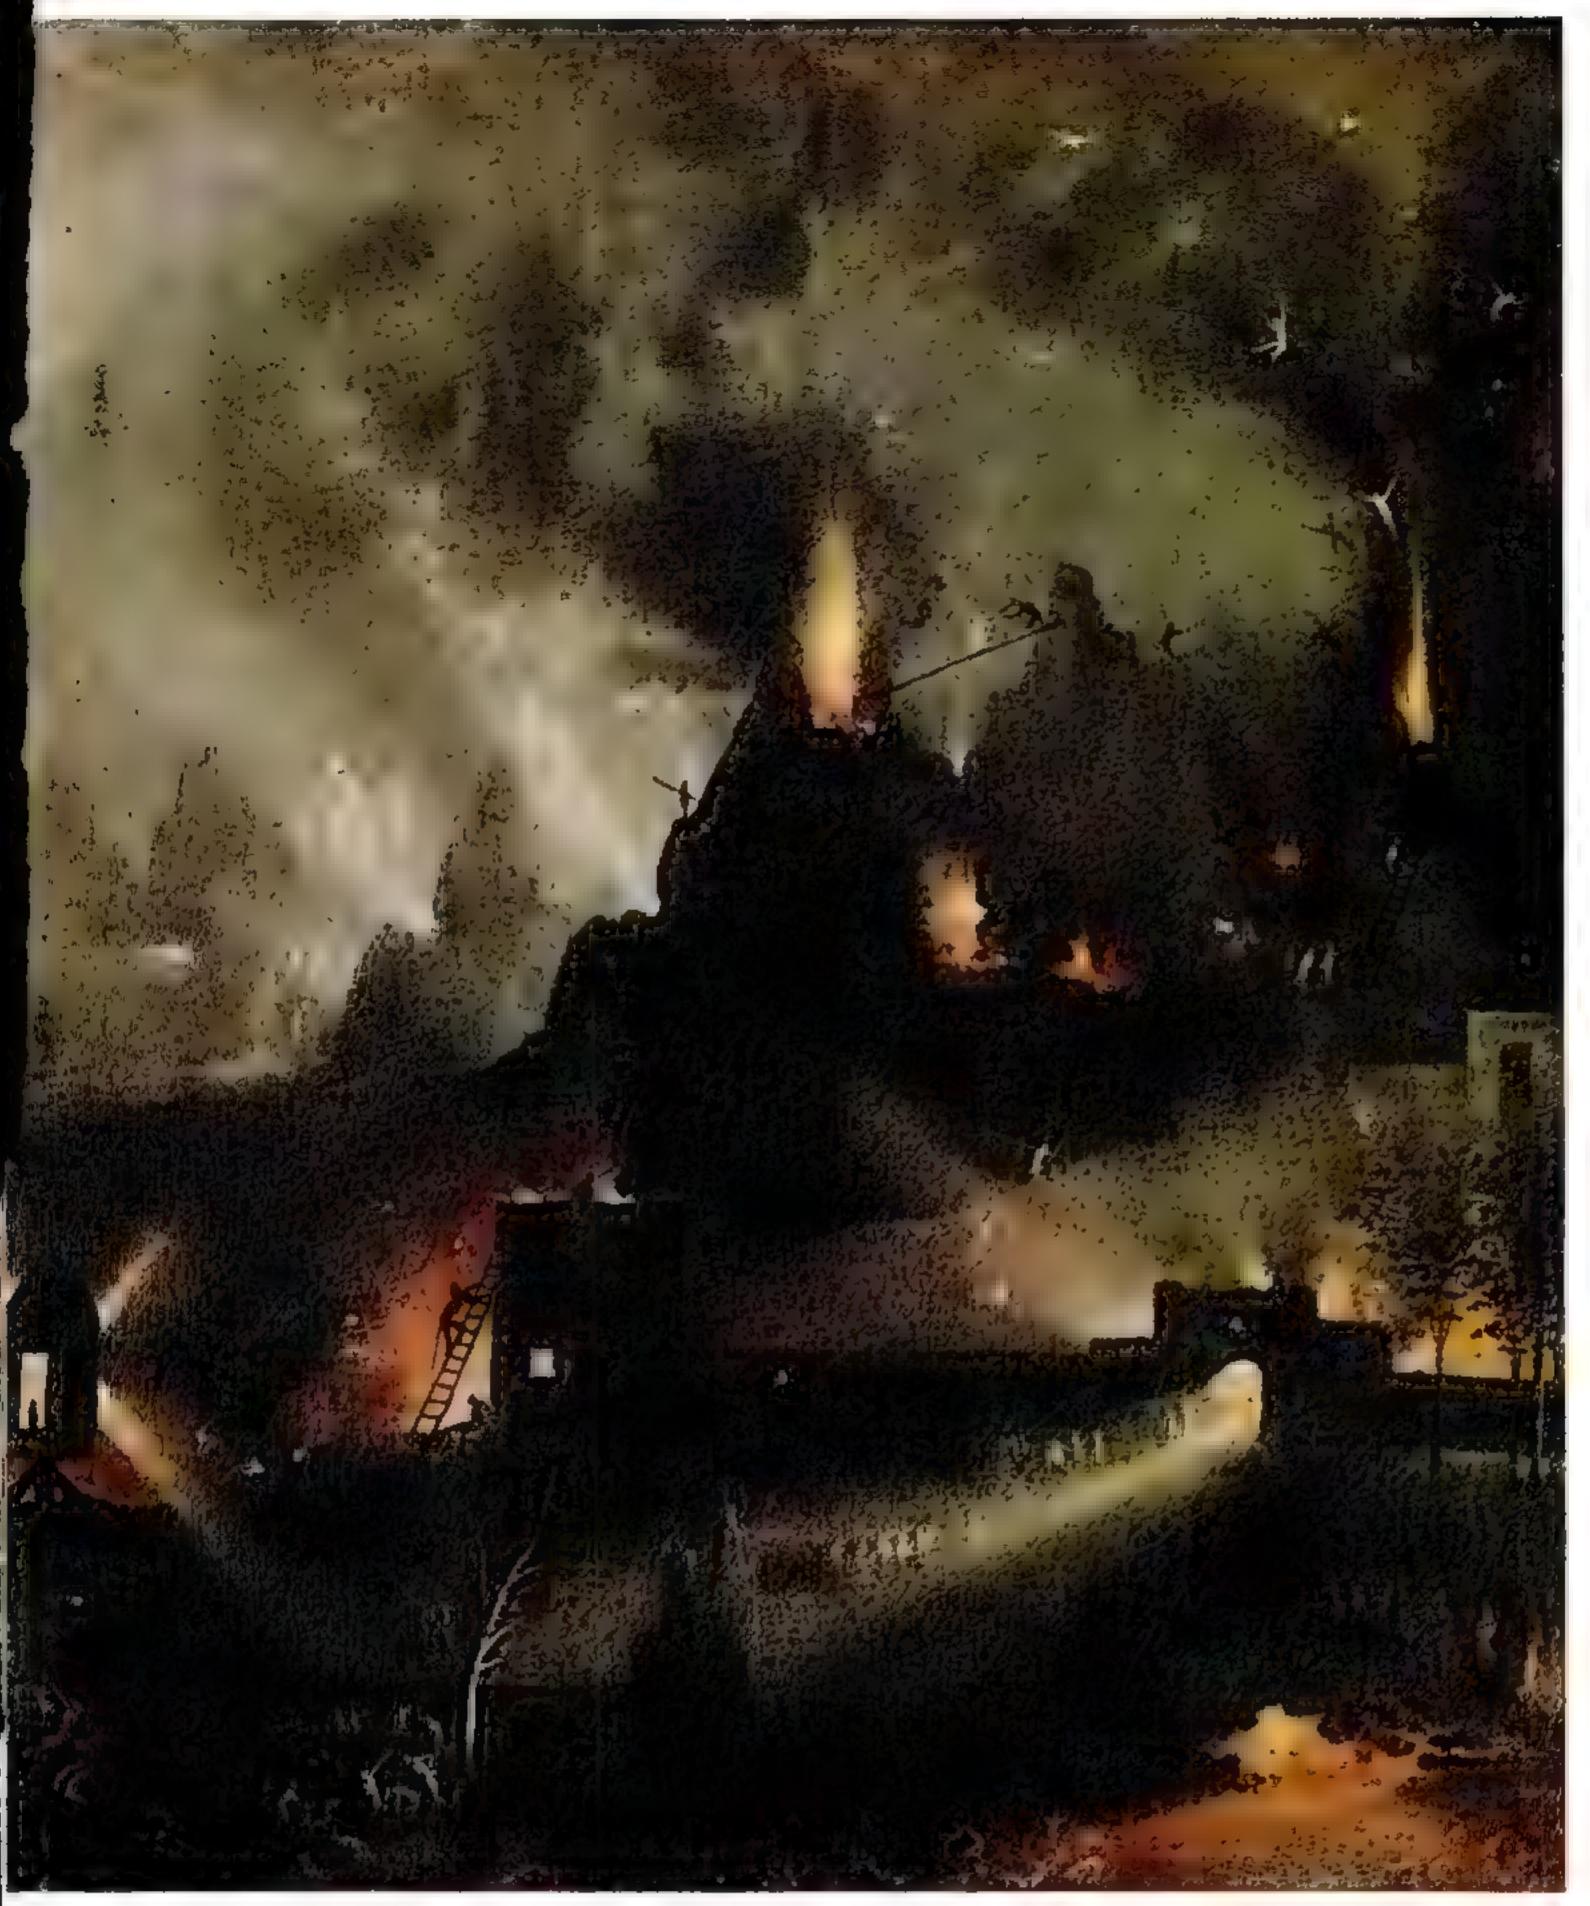

Throughout the center panel appears a theme of thorns and thistles. These illustrate a passage from Augustine's comments on another Psalm, 58, which reads in part, "the bramble bringeth forth your thorns. . . ." Augustine interprets this to mean that sins are delightful but eventually they begin to hurt and lead to inevitable doom. In the right panel, which portrays Hell, the ungodly reap the penalty for ignoring the advice given in Verse 2 of Psalm 33, "Praise the Lord with harp, sing unto Him with the psaltery of ten strings." In his version of Hell, Bosch painted a huge distorted psaltery (center) and has turned the harp (left) into an instrument of torture. On the following five pages are details from these panels

إيرا إنكلتنا الإلى الموسودة ويزاه وإمراسات

FIRE AND BRIMSTONE IN THE ABYSS

In this detail of the upper regions of Hell from the panel on the preceding page, Bosch shows the inferno of torture which was the common concept in the Middle Ages. Life on earth was so miserable that Heil had to be pictured as a veritable horror of horrors to achieve an impressive contrast with earthly existence. Bosch, whose Hell is the most awful ever painted, based this scene, according to Calas, on Augustine's comment on Psalm 148: "Praise the Lord from earth, ye dragons and all abysses. Fire, hail, snow, ice, wind of storms. . . ." Augustine went on

to say that it was impossible to escape the wrath of God. So Bosch filled his picture with frenzied, fleeing sinners. Over the bridge (lower left) pours a horde of noblemen. Others scramble from crag to crag on ladders. A swarm of culprits, naked because they are being punished for avarice, is plunging into the water which, in Augustine's words, is dyed red "with the blood of the only Begotten Son." The flaming building

in the center is a granary. Augustine said, "The Lord threateneth the barren and the thorn-bearing land with fire even as He prepared His granary for the fruitful." Since there were no fruitful in Hell, only indolent souls, Bosch set God's granary afire. Again turning to Augustine, he included a lighted watchtower (lower center), thus condemning the ungodly to watch forever for the coming of the Lord who will never come.

#### THE LUSTFUL RIDERS

The upper half of the scene above, taken from the center panel, reveals Bosch's scorn for heretical faiths. To portray their weaknesses, he drew from a passage by Gregory. He painted the heretical church as a sphere with no foundations masmuch as its pillars are precariously balanced on top of it, performing no function at all. Again turning to Gregory, who said that the actions of heretics are always in vain, Bosch placed some idle heretics aimlessly gossiping on the side of the church, clambering in and out of the water and standing on their heads. The lower half of the detail shows a portion of the circular cavalcade of sinful riders whose lust Bosch signified by painting them without reins. "Let [man] control lust," wrote Augustine, "let him hold the reins and not be carried away." To convey the kinds and degrees of sin the riders represent, Bosch painted them on animals bearing sinful meanings, which he found fully outlined by Gregory. The unicorn (right) stands for pride in heresy, the bear (next left) for the body without faith and the ox (center) for maddened lust.

#### THE HERETICAL OWL

With this dancing owl, also a detail from the center panel, Bosch levels another blast at heretics. According to Augustine, the owl is sometimes considered to be a symbol of Christ. Bosch took this idea and employed it to satirize the actions and thoughts of those heretics who represent themselves as being as perfect as Christ. Masked with the owl symbol of Christ, this heretic is portrayed by Bosch as a four-legged buffoon, ensuaried in the thorns of sin and proudly cavorting in a ridiculous jig. Unwittingly, according to Calas, he betrays himself as a representative of the devil because his two center legs and two upper arms form a monstrous parody of Christ's position on the cross. His four arms, moreover, form an X, which is the first letter of Christ's name in Greek. The double body signifies pride and lust and illustrates passages from Gregory that "these in truth are the two sins which hold cruel sway over the human race, one namely of the spirit, the other of the flesh" and that, just as Bosch exposed them in this masquerading owl, they are "cleaved together."

### MOUNTAIN OF HERESY

Like the sphere on the opposite page, this grotesque mountainous shape from the center panel represents a denunciation of the heretical church. Bosch took the idea from Augustine, who wrote, "For there have risen up leaders of heresy who have been mountains," In constructing this moun-

tain largely of roots, he drew from Gregory, who said the root denotes the sin of pride. To show again that heresy is destined to collapse, he joined the carrot shaped columns in the front with nothing more than a glass brace whose transparency signifies the emptiness of heretical thought.

### MAN, THE WASTREL, ROTS IN HELL

Sordidly, mockingly, Bosch summed up the idiocy and ungodliness of mankind in this detail from Hell. The rotting giant (man himself) standing in the twin "vessels of perdition" is surrounded with symbols showing how he defied the teachings of the commentators. "Let the horn trumpet raise thy courage against the devil," wrote Augustine. Because the giant's courage succumbed to the devil, Bosch ironically crowned him

with a ludicrous medieval bagpipe. The banquet in the giant's stomach, which is the belly of a horse, shows that he gorged himself on foods and wines and neglected all spiritual refreshment, while his face reveals a lustful and insane mind. His ears (upper left) have been cut off and attached to a gigantic knife stamped with the letter M, symbolizing the Midianites, a race of heathen warriors who were crushed by the followers of God.

# Holiday Cooky 5 DIFFERENT KINDS

We are always searching, here at Pillsbury, for new and simpler ways for you to make delicious baked things... like these Christmas cookies, for instance.

We've now found a way you can make five favorite kinds of cookies all at once... from one single batch of cooky dough! You do it just by adding an extra touch or two to our basic drop cooky dough.

And it's so very easy to stir up these cookies! You merely mix everything together in one bowl . . . vary your batch

as you wish... then bake! You do it all without stopping to beat eggs... without rolling or cutting dough. This new Quick-Mix cooky method, of course, is one we've worked out especially for our Pillsbury's Best.

Why not try it for your holiday cookies! And why not depend on Pillsbury's Best to help you bake traditionally fine pies, cakes, bread and rolls, too! You can count on this wonderful all-purpose flour, you know, to give you beautiful holiday baking.

# Inspiration.

ZIZI AND COLETTE are reigning ballerinas of Les Ballets de Paris. Renée ("Zizi") Jeanmaire (left) is famous for her acting as Carmen. Colette Marchand is famous for her legs which have been called the loveliest in ballet.

## Ballet

## TWO IMPORTED TROUPES ARE NEW YORK'S BIGGEST BOX-OFFICE HITS

Last month, with a gasp of surprise, Variety, the hardboiled journal of show business, headlined its front page: Ballet Bowls over Broadway. Not quite at home in a world of tights and tutus, Variety was reporting the enormous success of two ballet companies from abroad, which had opened in New York this season and become immediate sellouts. First came 30 youngsters from France, called Les Ballets de Paris, to put on a saucy, sexy version of Carmen. Three days later Britain's great Sadler's Wells troupe followed a \$185,000 advance sale into the Metropolitan Opera House and drew chandelier-shaking ovations for its classical Sleeping Beauty. Sadler's Wells attracted balletomanes who have been left in the doldrums by the decline of the once vigorous American dance companies. Carmen attracted audiences new to ballet but delighted by the lively and sometimes low-comedy numbers which made it as easy to take as a Broadway musical.

CARMEN THE TEMPTRESS (Renée Jeanmaire) has seductively in an iron bedstead in her bond or waiting the advances of her newest lover, Den José (Roland Petit).

THE LOVE-MAKING proceeds through an impassioned pas de deax in which Don José, the soldier whom Carmen has demoralized, throws his mistress around.

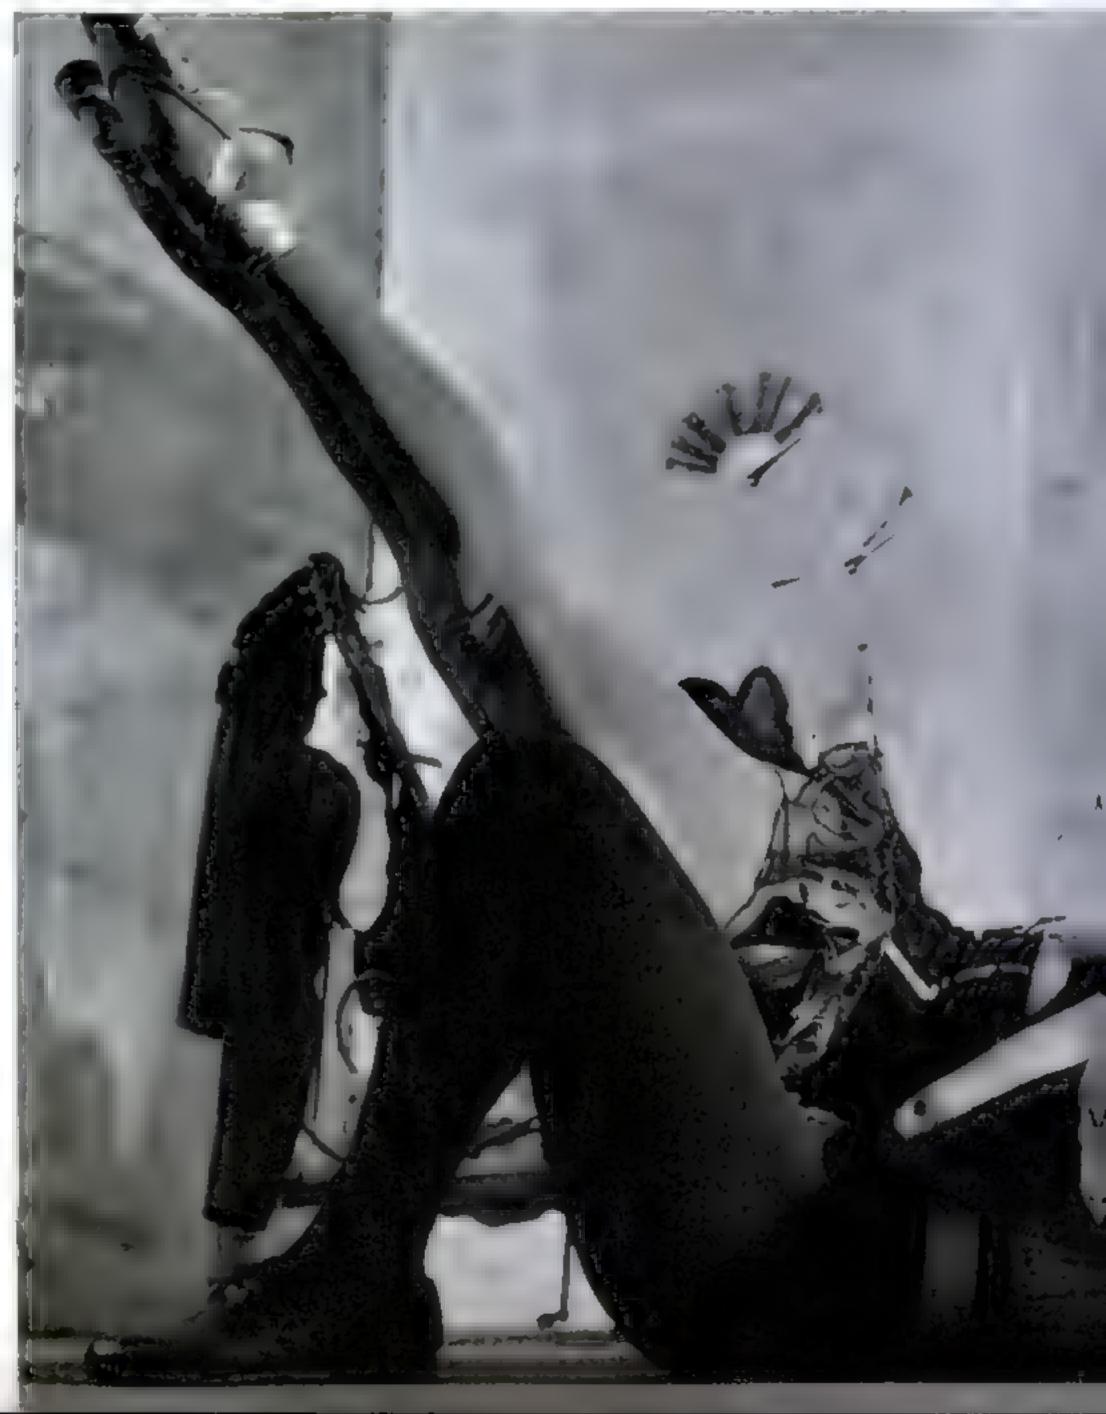

## FRENCH STAGE SEXY "CARMEN"

In making a ballet out of Carmen, Mérimée's century-old tale of a gypsy vamp, Roland Petit, 25-year-old leader of Les Ballets de Paris, fused Bazet's music with an crotic romp so full of openly expressed sex that one critic dubbed the company "Les Ballets de Minsky." Though not too greatly concerned with dance, it makes the most of Zizi Jeanmaire's expressive body and ends up as rousing good theater.

CARMEN IS KILLED by José after she has deserted him and gone off with a builtighter

scene draws budest applause of the evering

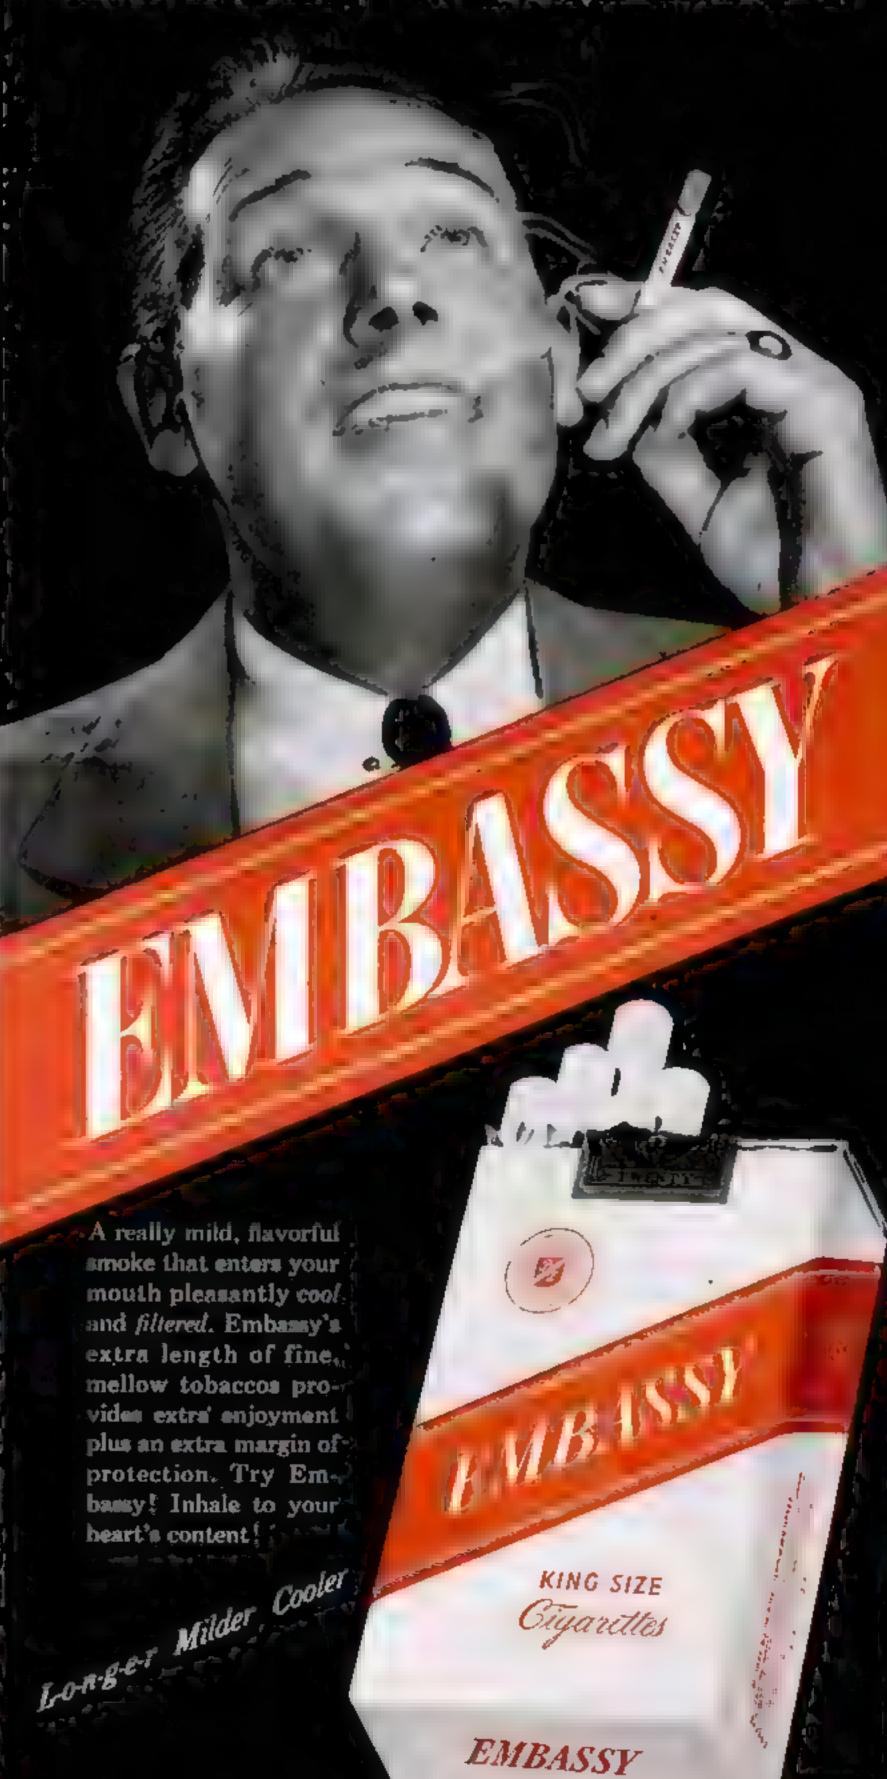

IN A GREAT LEAP Cormen and Don José near the climax of their scene. This provides one of the few recognizably classical moments in the entire ballet.

The pleasure's all yours

## Ballet CONTINUED

BEST DANCER seen by New Yorkers in years is Margot Fonteyn, English-born prima ballerina of Sadler's Wells.

## SADLER'S WELLS IS TOP TROUPE

The Sadler's Wells Ballet of Great Britain, founded 18 years ago, has survived the war to become the world's finest company—with the one possible exception of the iron-curtained Moscow Ballet which Western cities get no chance to see. They have brought to this country, in productions ranging from brief satires to four- and five-act spectacles, the elements of elegance, make-believe and beauty of movement which are the finest part of ballet. The reasons for the Sadler's Wells's achievements are simple: hard work, discipline and the generous backing of the British government. Two other good reasons are the brilliant dancing of its soloists, like Prima Ballerina Margot Fonteyn (above), who has few if any equals today, and beautiful, red-haired Moira Shearer (below).

LOVELIEST DANCER is Moira Shearer, star of movie The Red Shoes, who dances Cinderella for Sadler's Wells.

## LAST OF THE GOLDEN HORDE

Genghis Khan descendants end DPs

In the drab poverty of a displaced persons camp in Western Germany, 600 survivors of the Golden Horde of Genghis Khan are living out their days. Six centuries ago the galloping hoofbeats of their fierce forefathers spread terror from the China Sea to Europe's frontiers. Today these 600, stubbornly maintaining their tribal unity after 300 years of wars, wanderings and persecutions (map), are wistfully looking for the peaceful home which history has always denied them.

The Kalmucks (the name means "remnant") are the most homeless of Europe's 280,000 DPs.

Russia, to which they fied in 1627 when their Tartar empire disintegrated, is closed to them—they are fanatic anti-Communists. Their Oriental look (above) stamps them as aliens in an Occidental world. The 175,000 tribe members who were still in Russia when World War II began are now presumed dead in Siberia. Of the 5,000 who managed to escape to eastern Europe after fighting the Bolsheviks in 1917, some 800 found refuge in France. World War II reduced the rest to the 600 now in Germany. "We will live any place," they say, "where there is peace and where we can feel well."

KALMUCK MIGRATION began in 1627 in Mongoha (right). Attacked from all sides, tribe fought its way west to the Volga and Don rivers where they settled. In 1771, pressed by Czarist Russians, 300,000 began arduous trek eastward to Lake Baikal; 25,000 finally arrived in Mongolia. The remainder, stranded by Volga thaw,

succumbed to Russian rule until 1917 when they joined Cossacks to fight the Bolshevika. Defeated, their army fled to eastern Europe, to be scattered by World War II.

## Right on the tip of his tongue?

Naturally, Baby can't say the word texture. But he has ways of telling you which cereals, fruits, vegetables and meats "feel" just right on his tiny tongue.

How to get just-right texture? Get Gerber's—from Starting Cereals through Junior Foods. For, we've been making nothing but Baby Foods so long, we've learned lots of ways to perfect their texture and flavor—and nutritional values. Your doctor will tell you that how food "feels" to Baby's tongue is of prime importance. It's the first thing an infant notices about his (or her) very first cereal, for instance. Later when Baby's taste buds develop, he'll want the specially good True-Flavor of Gerber's Foods, as well as their Perfected-Texture! So why not start right—and stay right with Gerber's. They have more things that more babies seem to like!

PREE CEREALS | Write to Dept. LF 11-9, Fremont, Michigan. In Canada, Gerber's, Toronto.

Babies are our business...our only business!

#### Golden Korde CONTINUED

COWBOY MOVIES are Kalmucks' passion. Their ancestors were the world's best horsemen in their day, and the love of horseflesh has remained with them.

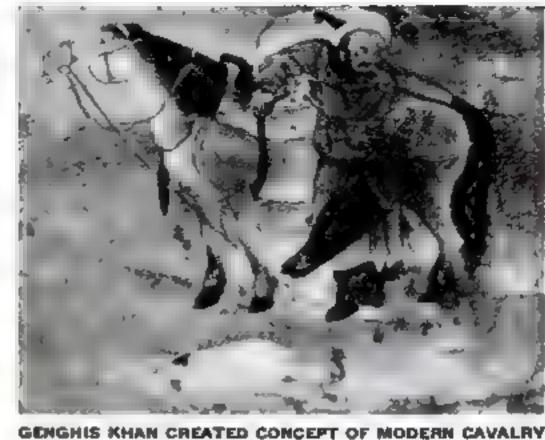

FOLK DANCES of Kalmucks are distinctly Russian, as are costumes worn here in dance of virgins. Little else has remained of their Mongolian traditions.

KALMUCK CHILDREN, despate the momentary defection of the little girl at left, are generally happy, fond of music and dancing. They are a cleanly, disciplined people,

but find it difficult to settle in Europe because of their Oriental appearance. Because of immigration restrictions, only a few families have come to U.S.—on the Soviet quota

## THEY STILL REVERE THE KHAN

To the Kalmucks today, Genghis Khan remains a great and revered figure. They attribute his legendary powers partly to the fact that (as Kalmuck history records it) he was born and died in the same month, the Month of the Pig (November). But the fierce qualities which distinguished him as one of the great conquerors of all time have died out in his descendants, who are herdsmen and farmers by trade. Their skillful horsemanship, however, remains, as does their devout Buddhist faith, which they manage to practice even in the rude quarters of the DP camps where they have put up little temples of their own (below).

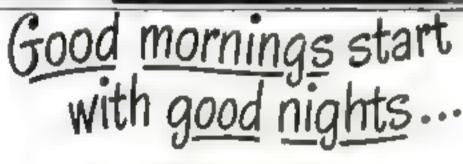

LOVERS OF HORSES, these Kalmuck DPs now have only one decrepit old nag on which to lavish affection, but they keep her groomed like a racehorse.

EVENING SERVICE is held by two elderly Kalmuck priests in a barracks room made to serve as temple. Services are in Tibetan, the Latin of Buddhism.

...and sleep-inviting relaxation starts with the fullaby comfort of an Ostermoor. Quality-built with the craftsmanship you rightly expect of its famous name.

#### School refuses to teach bigotry for \$50 million

It was just a matter of time, the trustees figured, before the old school would have to close down. The buildings were in terrible shape, the enrollment had dropped to a mere 48 boys and there was very little money in the bank. It looked like the end of Jefferson Military College in Washington, Miss, and the end of a proud tradition dating back to the days of Lafayette and Auron Burr. But then a man named A. J. Armstrong dropped in and mentioned a \$50,000 gift from his father. They put him on the Board of Trustees-it seemed the sensible tinng to do.

That was last May. The gift was coming from old Judge George Armstrong. (right), a multimillionaire who owned 38 plantations, as 1 it consisted of mineral and oil rights and thousands of acres of land. During the summer the trustees' eyes bulged as the gift grew bigger and bigger. The land was rich with oil, and the estimate jumped to \$5 milhon. New wells came in, and it climbed to a reputed \$50 million. The trustees started thinking in terms of new buildings and an enrollment of, say, 250,

But there were some strings attached. Under the gift's terms the trustees would be cut from 12 to five - three appoints a by the judge tone of his candidates; a notorious anti Semite. General Van Horn Woseley). An Ethen came. the kicker. The school would also have to teach and disseminate through every medium possible the true principles of . Christianity and the superiority of the Anglo-Saxon and Latin-American races "

When the terms of the old judge's gift were announced, the storm broke. Everywhere the press decided his plans for "white supremacy" and a "master" race." Then the trustees of the little school made an announcement of the page thought they had plans for teaching white supremacy, he was wrong, He could keep his \$50 million. Angrily the judge withdrew his gift, winning for this action the congratulations of Lycurgus Spinks, a Ku Klux Klan Imperial Chaplain. But Jefferson was also receiving congratulations from all over the South. By last week small checks (no strings attached) started pouring into the college and one Texan had given them \$5,000 for their firm stand.

OLD JUDGE ARMSTRONG, 84, has for years been embarrassing Southerners with gestures like his Jefferson fiasco. He made millions in cattle, banking, steel and oil. Now he will give Jefferson money to Judge Armstrong Foundation, through which he publishes pamphlets like Traitors ("President Truman Is a Communist Traitor") and Zion-1st-Wall Street ("The Rothschilds Run the World"). He says, "I am 80% anti-Semitic."

# SCIENTIFIC WEAPONS AND A FUTURE WAR

Intercontinental missiles? High bomber fleets? Carriers? A great scientist tells the facts about new weapons and explains how war can be averted or, if necessary, won

by VANNEVAR BUSH

S it true that a new all-out war, with atomic bombs and biological warfare, would destroy civilization and drive us back to the dark ages? Is the case so desperate that a prophylactic war is justified in order that we might at least meet the inevitable at our own time and on our own terms? Can a democratic regime develop great military strength without distorting its true nature?

There are no precise answers to these questions, just as there is no complete answer to the bigger problem of how to avoid another war. There are powerful factors present: science and democracy. Modern science has utterly changed the nature of war and is still changing it. And the demo-

cratic process has given us new controls over our destinies that are subtle, only partly understood, and also changing.

I believe, first, that the technological future is far less deadly and alarming than many of us have been led to believe, and that the hopeful aspects of modern applied science outweigh by a heavy margin its threat to our civilization. I believe, second, that the democratic process is itself an asset with which, if we can find the enthusiasm and the skill to use it and the faith to make it strong, we can build a world in which all men can live in prosperity and peace.

A new era in warfare started with the First World War. Two great innovations were responsible for this. The first of these was the development of precision manufacture and mass production. The second was the internal-combustion engine. Between them they made mechanized war possible, and the world will never be the same again.

On land the First World War became a deadlock very early. The creation of complex automatic devices in quantity—such as the machine gun—and the development of simpler effective instrumentalities—such as barbed wire—ended forever the hot rush of masses of men and replaced it with doggedness, a new kind of courage and endurance and a skill at operating machines under stress. For the first time the factory behind the lines became a dominant element in the whole paraphernalia of war.

The same mechanical processes that produced wire, artillery, or the machine gun could also build tanks, and the internal-combustion engine using petroleum products was available to propel them. The tank could knock down the wire field, and men could follow. But the tank became an orphan that received scant support, so that it appeared in quantity only when the exhaustion of one camp had already made the deadlock tenuous. The internal-combustion engine had also made the aircraft possible, and men had flown for a decade before the war began. Yet the participation of military aircraft in that war was an incident without a determining forter.

an incident rather than a determining factor.

Another innovation that appeared in land warfare we need to note because it was the forerunner of new things—poison gas.

On the sea also there was a beginning of a revolution in methods,

In recent weeks a bitter public debate has been staged by the Army, Navy and Air Force on the U.S. defense program. The argument is highly technical, involving weapons based on scientific advances which most citizens understand but dimly. This article provides a dispassionate guide to what U.S. security policy should be. The three sections which follow the introduction on this page deal with some of the most important new weapons and their application to land, sea and air warfare. The concluding section deals with the nature of total war in the atomic age. The author is this country's foremost scientific military authority, director during World War II of the Office of Scientific Research and Development. His article, prepared especially for LIFE, is based on his new book, Modern Arms and Free

Men (Simon and Schuster; copyright, 1949, Trustees

of the Vannevar Bush Trust), to be published Nov. 21.

but only a beginning. The computing device that aimed the great guns of the battleship automatically allowed for the course and speed of ship and target; it introduced into its computations the deflection of the shell owing to the rotation of the earth, gravity, and the barometric pressure.

The great innovation of sea warfare was the submarine. It was thoroughly underestimated when the First World War broke out; there were in existence practically no means of combating it, and, despite its crude form, it nearly determined the outcome of the war before it was overcome by the depth charge and the convoy system.

Radio also appeared in the First World War. The embryo of great

developments, it was useful primarily for communication at sea and to correlate movements in sea battles, but it presented in use most of the beginnings of what led later to the extraordinary ramifications of what we now call electronics.

When the First World War ended there were thus in existence nearly all the elements for scientific warfare. What did the world do about it? It went to sleep on the subject. So the Second World War began where the first one ended. There were a few exceptions.

The greatest peacetime development, from a military standpoint, was in the field of aeronautics. Here there were many forces at work. Primary was the coming of age of air transport, with plenty of vicis-situdes, but in the hands of true pioneers who did not shrink from taking a risk and did not settle into their collars when a technical innovation was proposed. Second, there was genuine military interest here, and real stimulus by military orders and development.

During the peace the techniques of artillery moved ahead in the slow way in which the art of firing projectiles has always moved since the days when guns were first rifled and explosives first placed in shells. The whole gamut of new ordnance devices—rockets, recoilless guns, guided missiles, proximity fuzes, bazookas, frangible bullets—waited for the pressure of war, appearing then largely outside the organized system of ordnance development, and sometimes in spite of it.

During the interval of peace two military devices of importance were developed in governmental laboratories and associated industry and kept very secret. They were radar and sonar. And all the time, between wars, the science of the atom moved steadily forward.

The Second World War was, far more than the first, a war of applied science. The great campaigns that swept across the continents and the oceans drew so heavily on the accumulated stockpile of fundamental scientific knowledge that this was all but exhausted when fighting stopped. Should a new war have to be fought in a decade or so, there will be innovations, but in all serious probability no such burst of new devices as accrued when organized science and engineering first turned their full effort into war, drawing without inhibition or restraint upon the great unused accumulations of the past.

# WAR ON LAND MAY

THERE is no longer any such thing as exclusively land warfare. Amphibious operations and the interaction of air operations with the movement of armies ended all that. But we can neverthe-

less look at land campaigns as a phase of warfare.

When the Second World War first opened actively, after Hitler had consolidated his conquests in the east while the Allies waited behind the Maginot Line, it soon became evident that the deadlock on land, characteristic of the first great war, was virtually a thing of the past. Masses of mobile artillery could prepare holes, and cavalry in the form of the tank-air team could exploit them. Hitler conquered the Continent because his army had so perfected this method that it overwhelmed customary resistance.

After a long interval, the war on land ended with the same sort of sweep over Europe with which it had begun—the breakthrough of lines, the wide cavalry sweeps, mobile warfare in all its rush and complexity. From this fact it would be easy to jump to the false conclusion that there had been no real change in the interim, that the deadlock on land of the first war had been permanently and universally broken in the early part of the second war. Actually, the facilities of defense had improved enormously, and the means of successful breakthrough in 1940 had become utterly obsolete by 1944. In the final breakthrough many new factors were present: long preparation by bombardment of communications, exhaustion of the enemy after five years of war, the finest armies the world has seen, effective coordination of allies in the field for the first time in history, unprecedented industrial production and magnificent leadership.

The question of how matters now stand in regard to a deadlock on land may be argued at length. It is certain that the fully prepared lines of a competent industrialized nation are not going to be broken by an enemy of equal size unless the latter is capable of operating effectively in the field large masses of highly advanced technical

# END IN DEADLOCK

equipment, and this is true even assuming the presence of atomic bombs in moderate quantity on both sides.

One of the new primary aids to the defense that appeared in the interval was the use of great quantities of land mines. In the contest between land mines and means for removing them, the mines won out. Portable devices for detecting metallic mines were successfully developed; they worked along much the same lines as the defective radio set that whistles when one waves his hand near it, but they were avoided by the plastic mine. Dogs were taught to smell out runes, and they did, but there are too many ways of tricking dogs for this to be of much use. Great rollers, pushed ahead of tanks, i.a. pable of withstanding nune explosions, had some success, but not much; an occasional very large mine could wreck them. "Snake" - pieces of hose full of explosive, capable of being pushed ahead or pulled ahead by a small rocket—could be exploded to clear a lane. Tanks equipped with a succession of these devices could proceed, provided the tank itself was not destroyed, but this was a laborious method indeed for fields of great depth. Very light vehicles, in particular the Weasel, a treaded vehicle of low-unit pressure, could proceed over mine fields set for heavy vehicles, but this machine was not armed or armored, and mines set for light pressure could stop it. The Russians apparently merely ignored the fields, moved ahead and accepted the losses. These could be very large-for example, when mines were built to project a can of explosive into the air to explode there and spread fragments over an area. The ratio of losses on the eastern front as the Russians advanced reflects this fact. The days when hordes by their mere number could overwhelm fully prepared positions approached their end.

Moreover, toward the end of the war, a defensive element entered that the Germans did not have and that added enormously to defensive possibilities. This was the proximity fuze, which is considered here as used by artiflery against ground troops in the open. The

"Removing heavy stage make-up keeps my face sensitive," says Ray Bolger, famous Broadway star shown here in his dressing room, "But getting close, comfortable shaves is no problem since I started using Williams Shaving Cream. It's easy on the skin—never irritates,"

#### Close, easy shaves

Williams is made from top-quality ingredients, blended as precisely as a doctor's prescription. In Williams you enjoy the benefits of over 100 years' experience. Its whisker-wilting lather soaks wiry beards completely limp—lets you shave quickly and cleanly. Get a tube of Williams today.

If you prefer a brushless shave, you'll find the same luxurious shaving cream qualities in the new heavier and richer Williams Brushless Cream.

#### YANNEVAR BUSH CONTINUED

old method was by timed fire, that is, by a fuze in the shell timed to cause it to explode at a chosen distance above the ground, where-upon the shell would spread its shrapnel in a deadly cone directed nearly downward. Timed fire could be used only when one could see the ground, and it was not very precise. The proximity fuze contains a little radio set that triggers off the shell at a predetermined distance above the ground. No observation of bursts and no difficult presetting are necessary.

The advent of this fuze increased the effectiveness of artillery against personnel in the open by a large factor, perhaps as much as ten times, and this gain was equivalent to having ten times as much artillery at work. When artillery effect is multiplied against moving men there is a strong turn in favor of the defense. The proximity fuze appeared in land use just at the beginning of the German counteroffensive in December 1944, at the Battle of the Bulge. Especially on the northern side of the German breakthrough it caught German troops in the open, in the fog, at road intersections, as they advanced, and it spread consternation. Its power was by no means fully exploited; this was a first use, and artillery officers, and especially the high command, by no means appreciated what had been placed in their hands. Yet, by means of this fuze, together with air effort as the fog lifted, the lack of fuel on the German side, determined resistance and defiance exemplified best by the historic remark of the commander at Bastogne, and adroit movement of divisions, the breakthrough was stopped before it could be effectively exploited. The proximity fuze may well have saved Liége.

A mine field, adequately covered by artillery or mortars with proximity fuzes, is a formidable line. Mere combinations of tanks and men will not penetrate it. The tank, moreover, nearly met its match in the last war; perhaps it should have. A limit to the practicable size of tanks and the thickness of armor that they can carry is imposed by the necessity that they shall not bog down in the softest going to be encountered. An explosive charge can be constructed, and a relatively small one at that, that can penetrate the thickest armor they can carry. This is because of a very old principle called the Munroe effect. A mass of explosive, properly shaped to focus its effect, triggered off at the right instant and in the right manner, will bore a most extraordinary hole in steel or in anything else. Through the hole goes a deadly blast. This principle was used in missiles fired by the bazooka, a light rocket-firing weapon that could be carried and fired by one man. Its muzzle velocity was very low, its precision was poor, it was dangerous to use, but it could stop a tank, and its advent was new strength for the infantry.

Another innovation that spelled difficulty for the tank was the recoilless gun. This was a gun that shot forward and backward at

TANKS CAN BE STOPPED. The soldiers at right are shooting a lightweight recoilless gun, firing shells utilizing the principle of the Munroe effect, which

the same time. Such a gun sounds like an inventor's lurid dream, and there were many such, but the forward effort could be caused to give a projectile good muzzle velocity and precision in a rifled barrel, while a backward blast through an orifice removed the recoil and was harmless unless someone inadvertently got close behind the gun. The importance of this innovation resided in the fact that it produced a powerful, relatively inexpensive weapon of low silhouette, readily moved and used by a couple of men, and hard hitting even at a moving target at some distance. This weapon and the shaped charge were never combined. There seems to be no inherent reason why they should not be. A tank wandering through a country infested with such weapons would have a short life.

The airborne-infantry assault should also be considered in any discussion of improvement of defensive means on land, for this might be a way of breaking defensive lines. Techniques for airborne assault were much improved during the war. But the experience of Crete, Normandy, Arnhem, the Rhine crossings, showed rather well that the airborne assault is an auxiliary to the advance rather than a means of starting wide sweeps behind the enemy lines. Wide cavalry sweeps, in these modern days, require vehicles and plenty of them; any slow caravan in an armed hostile country will be overcome by highly mobile forces concentrated against it. A weak island might be thus attacked, but it would have to be decidedly weak. The much heralded airborne assault is an aid to a breakthrough and apparently not much else. We are not interested in the assault by an armed nation upon one that is unarmed in a modern sense here air assault might work, but probably would not be necessary. There might be a place for airborne assault in connection with surprise invasion on the scale of an enlarged Pearl Harbor, although this is doubtful. As an aid to breakthrough, to reduce casualties and risk in any case where there is control of the air and when the breakthrough is going to occur in all probability anyway, the airborne assault has its place, and as such an aid it was skillfully used. An airborne assault attempting to penetrate a line adequately protected by early warning and interception radar, and possessing fast interceptor planes equipped with radar for night use, would be a suicide attempt.

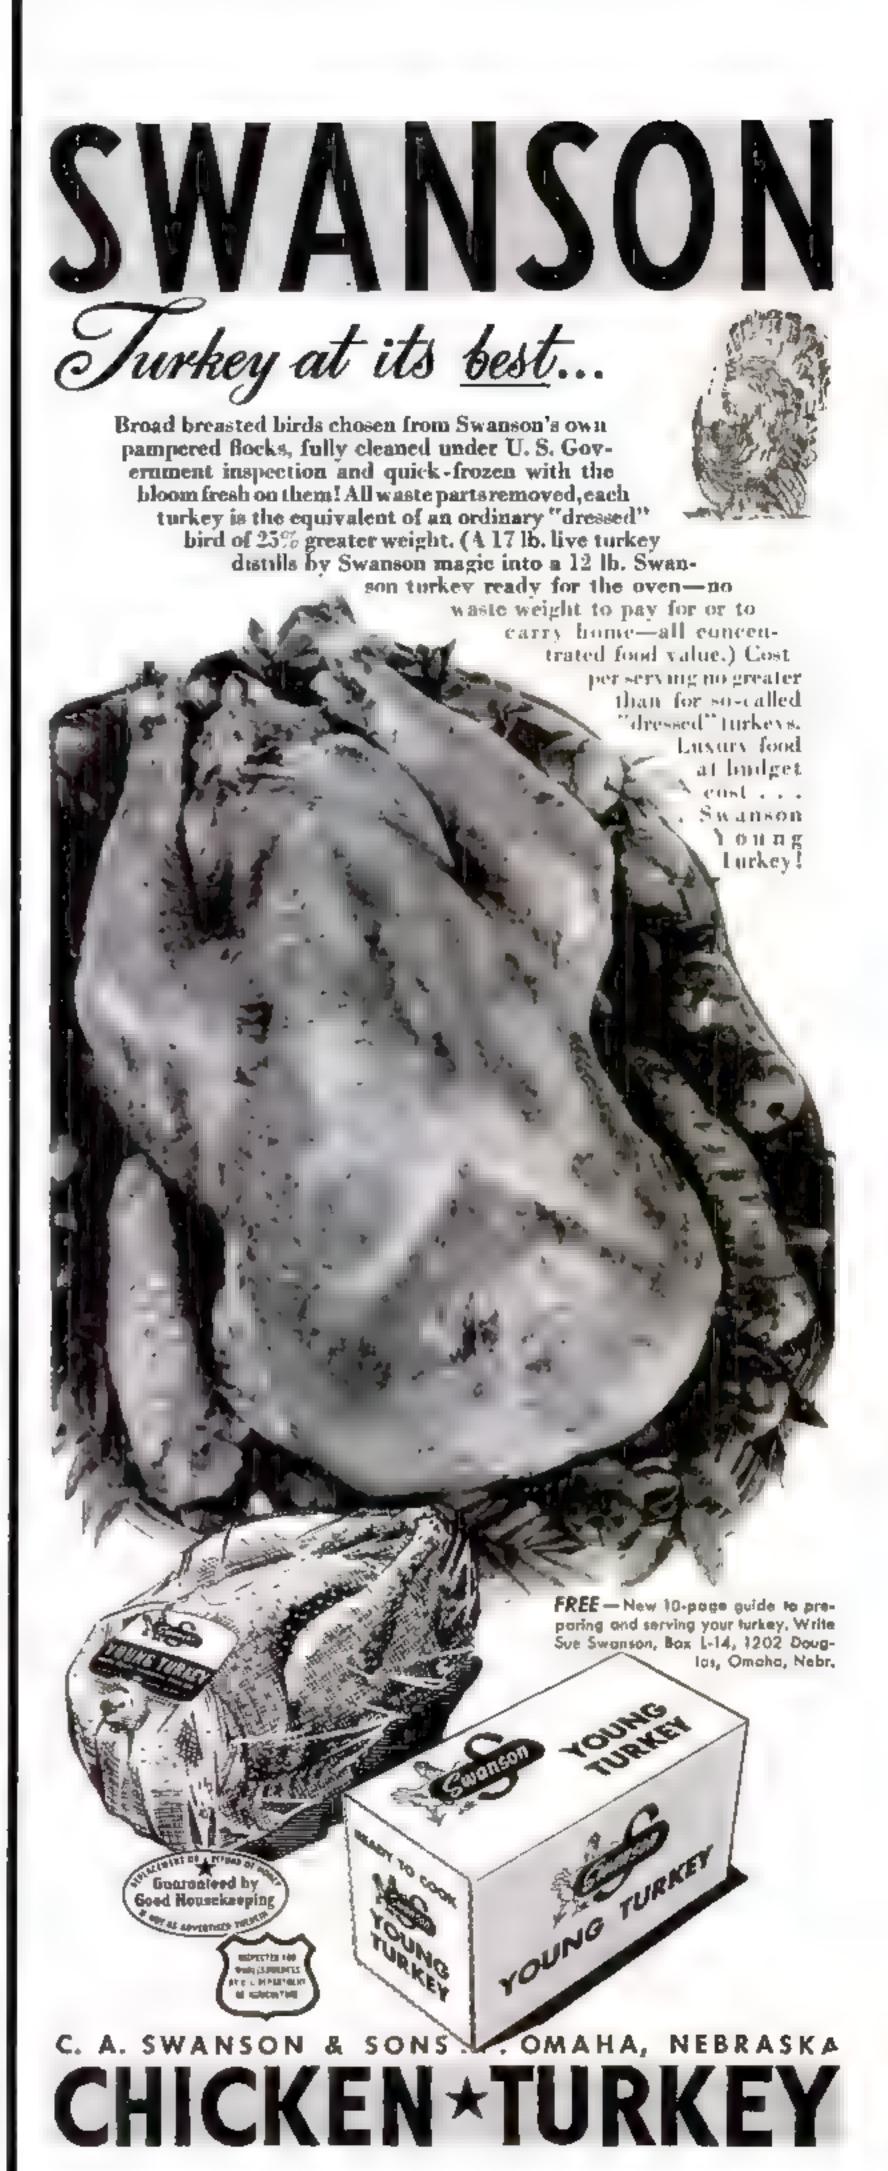

There is a strong indication, therefore, that the defense may again be in the ascendant in land warfare, that the deadlock of the First World War might well reappear if antagonists substantially equal from the standpoint of skilled use of ample technical devices met again at a long land frontier. This might merely throw the weight of the effort elsewhere, but it is an important factor to con-

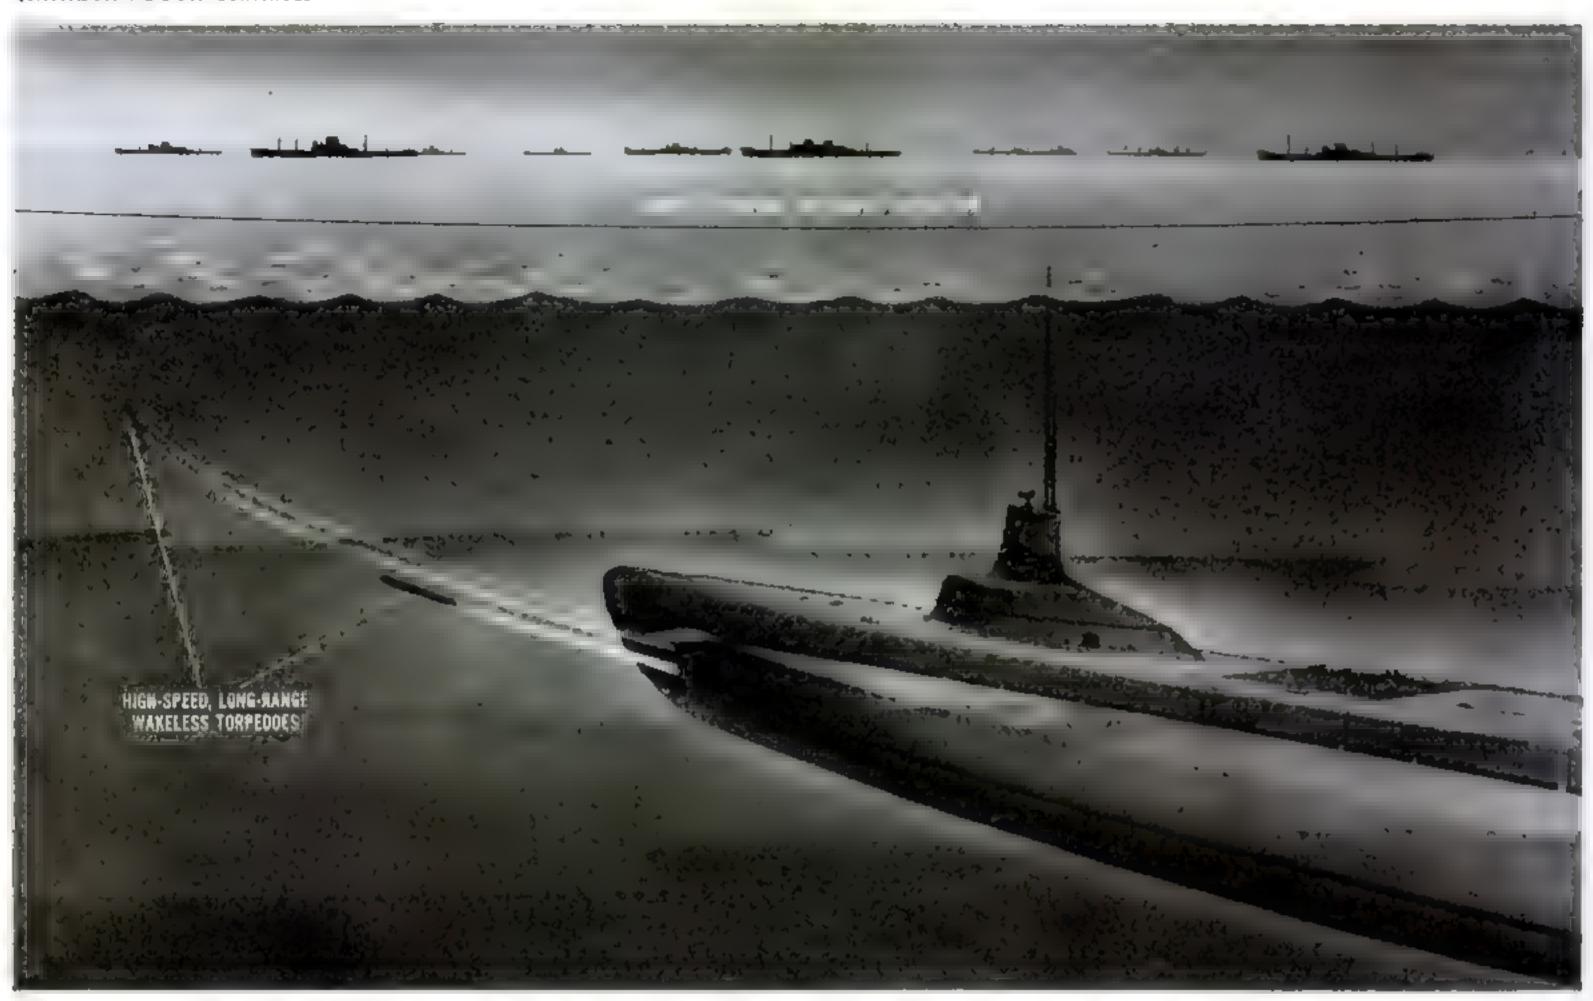

sider as we look to the future.

can blast boles clear through even heavy armor. Land mines have knocked out some machines, and rocket-firing planes are attacking others still under way.

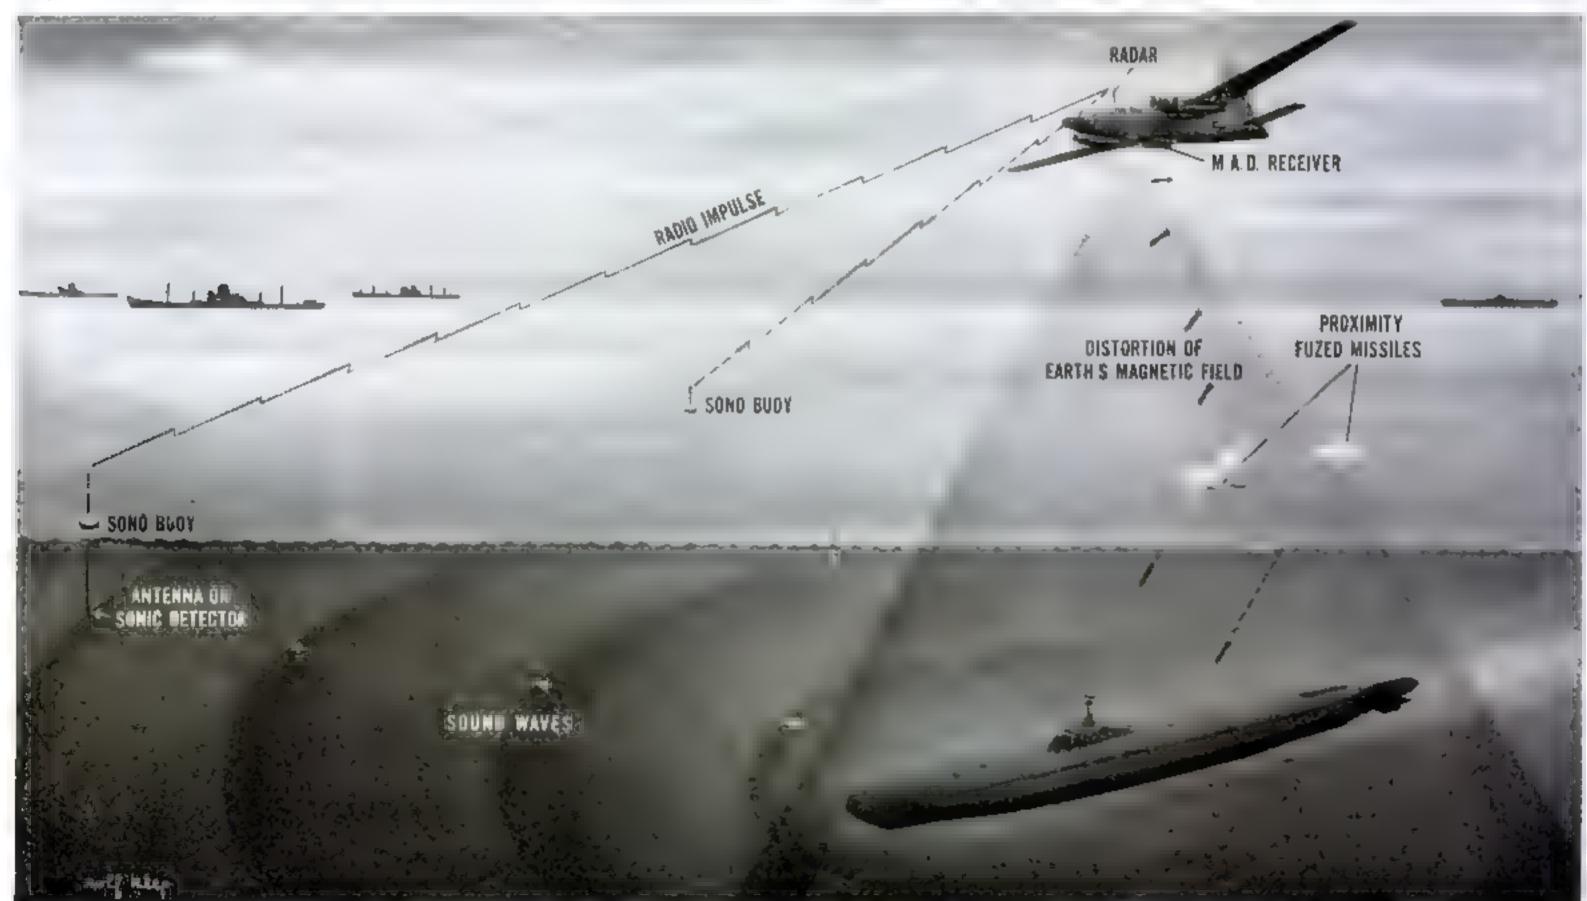

CONTINUED ON NEXT PAGE

A SUBMARINE ATTACKING ships no longer need risk discovery by coming in close for the kill. Convoys depend on sonar, a radio-detection device for underwater use, and air patrol to warn of approaching submarines. But a modern submarine, equipped with

schnörkel to avoid the necessity of surfacing for air, can stay out of range of the convolvence and air-patrol detection and fire long-range torpedoes from its stern even where making a getaway at high speed. Homing devices take the torpedoes to the target.

PLANE TRACKING A SUBMARINE begins by dropping sono buoys which lower microphones below surface. Microphone- pick up and transmit to plane sound waves from submarine, as shown by arrows above by which position and movements of tar

get are traced. To learn when it is over target plane uses magnetic airborne detection (M.A.D.) receiver which picks up distortion caused in the earth's magnetic field by submerged submarine. Kill is made by special missiles, not by old-fashioned depth charges.

# AT SEA SUBMARINES ARE THE BIG THREAT

THE last conflict may well have seen the end of that most dramatic of the scenes of war: the clash of great fleets and great ships. The whole evolution of sea warfare in World War II, from a technical standpoint, revolved about radar. Radar had its real origin in 1925, when two physicists performing experiments for purely scientific reasons sent out short radio pulses and studied their reflections from the ionosphere, the conducting layers above the earth that reflect radio waves. There are two ways of using radiation to find the distance to an object; one, to examine the interference pattern of continuous radiation, and the other, to send a short pulse of radiation and examine the echoes. The first was used in the proximity fuze, and is excellent for short distances. The second readily won out as the better for radar use.

The sensitivity of radar, and its precision, are both remarkable. Using cathode-ray tubes in much the same way that a television tube displays a scene, radar can make the earth visible from a plane above the clouds, in fog, or at night, with a detail as though one had a map spread out before him or could see through the obscuration. Such an instrumentality was bound to revolutionize many depart-

ments of warfare, and it did, especially on the sea.

There were great fleets of fighting ships in existence when the war started and they were bound to clash. As always, in naval shooting war, the decision in the long run went to the ships that could shoot straightest, soonest, and under most difficult conditions. After stumbling beginnings, we could shoot best, for we had the best radar, and the issue was no longer in doubt. The days of great battle-ships seem to be over. They passed from the scene because the great carrier took over their functions, with its longer striking range. Even the day of the great carrier may be past. It is by no means an open-and-shut question, but one that will stand plenty of dispassionate analysis. We shall see.

The war ended, or became a contest against a relatively unskilled or unequipped enemy, before the full evolution of warfare on the surface of the sea had run its course. So one development of great potential significance that appeared here and there did not come

into full use. This was the guided or homing bomb.

#### The threat of the guided bomb

DOMBING from moderate or high altitudes with ordinary bombs is a very haphazard affair. It is quite possible, however, to guide a bomb after it is released, and throughout the half minute or so of its fall, and thus attam real accuracy. This can be done either automatically or with manual controls, and it has been done in diverse ways.

Is there any effective defense against the very high bomber using guided bombs? If there is not, the days of large fighting ships—carriers as well as battleships—are over. In all probability there is a defense, but how effective it may be will be questionable for a long

time to come.

In a possible future war, if it should occur while the world has its present general interrelationships, the only enemy fleet of any mo-

ment would be a submarine fleet,

The First World War showed the ability of the submarine to interrupt commerce, even though the U-boats of those days were clumsy, fragile affairs. In the interval of peace two things happened, one to the advantage of the submarine, one to its disadvantage. The submarine acquired more underwater speed, longer endurance, and a tougher hulf. By the time the Second World War opened it could submerge rapidly to several hundred feet and maneuver in tight circles. The submarine could always use listening devices just as well as a surface craft could and this fact, added to better performance, made the old forms of attack on the submarine practically obsolete. The depth charge, even when the second war began, was nothing but an ash can filled with TNT with a hydrostatic fuze to explode it at a given depth, and it sank at a rate of only five feet per second, so that the submarine had considerable time in which to get out of the way and, with its higher speed and greater depth of submergence, could usually do so.

However, during the peace, a very important means of detection

#### VANNEVAR BUSH CONTINUED

had been developed in naval laboratories both here and in England. This was called asdic at the time, and later sonar. It is to underwater detection what radar is to air. The ship carrying it emits a pulse of sound of relatively high frequency and then examines the pattern of returning echoes. By timing the interval, and by a directional receiver, the distance and direction of the submarine can be obtained. In later forms asdic, or sonar, could also supply a determination of depth of the enemy. It was a powerful adjunct indeed.

It is important to note that radar pulses cannot travel more than a few feet under water. Moreover, there are strict limits as to what can be done with sonar pulses and their reflections, because of attenuation of the signal and confusion of echoes from the bottom, so that a few thousand yards under good conditions seems to be the limit of range. There is no such thing under water as radar's range of many miles in air. Still, sonar seemed to be the answer to the submarine as it then existed.

Perhaps it would have been, if there had been an equal advance in attack weapons, but we entered the war with the same old ash cans and held to them tenaciously even though they were clearly outdated. The undisputed power of sonar gave us overconfidence, and we paid for this later in excessive sinkings.

Even the presence of sonar did not assure protection of convoys. Part of the trouble was the fact that sonar sometimes is severely limited when temperature distribution in the sea is unfavorable. Limits were set on the effectiveness of searching craft by the fact that their sonar would not work at high speeds. But the principal limitation was the fact that depth charges were not much good. Submarines could now work into position ahead of a convoy, discharge their torpedoes, and then by going to great depths be rather sure of getting away safely. Depth charges that were at least streamlined to sink more rapidly were belatedly developed, something was done about installing proximity fuzes on them, and these changes helped. But the odds were still on the submarine in surprise attack on a convoy or an isolated ship, and losses mounted to serious proportions.

To be overcome, the submarine must first be spotted in the broad reaches of the sea, then more accurately located by pinpointing methods and pursued while it remains submerged, and finally destroyed. There were striking advances in all these fields.

There were two great methods of broad search, highly effective at the time, and now both obsolescent or greatly reduced in value. The first of these was direction finding by radio, and the reason it was of great value was that the Germans made an error that may not be repeated. They communicated by radio from Berlin with their submarines continuously throughout the war. Radio stations listening to their messages could take cross bearings and give a rough position of the sending submarine.

The second great method was that of radar. The submarines of the day had to spend a considerable fraction of their time on the surface to charge their batteries. When on the surface they could be detected by radar at a distance of 20 or 30 miles. A radar-equipped plane could therefore sweep great areas, as much as 5,000 aquare miles an hour. Even the enormous areas of the open ocean begin to yield when fleets of planes are thus equipped.

#### The bunjer-killer group

THE most deadly combination, however, was the hunter-killer group. A small aircraft carrier and other surface antisubmarine craft accompanied a convoy, or left it for direct attack upon a U-boat concentration. Radar sweeps gave the necessary knowledge of position, and specially equipped aircraft alone or in combination with surface craft pressed home the attack. When we thus carried the war to the enemy, the tide began to turn.

For precise following of a submerged submarine there were several developments. Sonar remained the mainstay and, while its range was not radically increased, it became more versatile and dependable. It finally came to the point where a submarine once caught in the sonar beam of a surface ship, when sonar conditions were good, could hardly expect to maneuver in such manner as to escape.

Magnetic airborne detection, M.A.D., also appeared. While severely limited in range it could find a submerged submarine by the distortion the submarine produced in the earth's magnetic field.

The sono buoy supplemented these means and was particularly useful from aircraft. One cannot listen to a submarine's underwater noise from an aircraft, or for that matter from a surface craft at high speed, which is itself making so much noise as to drown out all else. But one can drop a small buoy to lie quietly on the surface, listen through a microphone that it lowers to suitable depths, and broadcast by radio what it hears. When a submarine submerged

after having been caught on the surface by radar, it was no longer safe, even if no surface-hunting ships were present. Aircraft could keep contact with it by rings of sono buoys, each dutifully sending its identification signal and the news of the submarine's progress. Aircraft, in relays if necessary, could thus keep the submarine under surveillance until its underwater endurance was exhausted and it was forced to surface and meet its pursuers, or until surface craft could arrive and take up the trail by sonar. Moreover, new means

appeared for attacking it while it was still submerged.

The depth charge was really obsolete, but remained in fashion for a long time. Forward-thrown weapons were inherently more effective. The forward-throwing weapons sprayed a pattern of charges well ahead of the attacking ship, by spigot guns or rockets. These charges sank rapidly, and when one hit the hull of a submarine it blasted out a hole bound to be lethal. The weapon was designed to cover an area with a pattern of charges like a shotgun pattern, leaving no gaps, and thus shooting became more deadly. Most important, it could be directed to one side or the other in accordance with last-second sonar observations and could be fired while the submarine was still under sonar contact, not after the attacking vessel, in passing over the submarine, had lost contact.

#### Submarine-killing planes

THE rocket-carrying plane was appallingly effective. A highspeed plane, having located the submarine by radar, could come diving in at a moderate angle. It could switch on a blinding light for a final guidance or fire by radar alone. Its most deadly weapon was a rocket with a solid head. This was aimed to hit well short of the submarine; it had a long, shallow underwater trajectory; when it hit a submarine it went clear through, leaving a gaping hole on both sides and chaos within. It almost appeared that the day of the submarine was over, not only for the war but permanently. It might have been, except for two new and important improvements in submarines themselves. These two innovations were the high-speed submarine equipped with schnörkel, and the long-range torpedo.

The Germans had designs of high-speed, relatively quiet submarines and built a few, now known all over the world, but they did not build them in quantity. Their importance lies in the fact that they can readily get into position for convoy attack and es-

cape afterward.

The schnörkel was, however, even more important than more speed. It is merely a pipe arranged so that the submarine can run submerged on its engines, with only a small end of the pipe sticking out, like a swimmer breathing through a long straw. An ingenious contrivance prevents difficulty if the seas slop over the top of the pipe, by momentarily closing the pipe so that no water enters, and this is the real technical advance. In the brief intervals when the pipe is closed, the engines draw their air from the hold of the submarine, with some crew discomfort, but otherwise without reducing performance. Such an affair as a schnörkel is very hard to see at all, either by radar or by eye, when there is a bit of sea running. It does not make the submarine completely immune to radar search, but it decidedly decreases the effectiveness of such search. It is undoubtedly possible to build submarines that run on their engines when completely submerged, thus dispensing even with the schnörkel.

The long-range torpedo is much more important than it might seem at first glance. It introduces an element of surprise that is highly significant. The point is that the range of sonar against submarines is limited, and the range of a torpedo can be made to exceed it if one makes the torpedo large and expensive enough. Thus, if a surface ship can know of the presence of a submarine only by its sonar, and if the submarine can fire a deadly torpedo from well outside sonar range, the advantage seems to be entirely with the submarine, which can pick off the escorts of a convoy and then close

in for the kill.

The fact that emerges is that the day of the submarine is by no means over. Twice in recent history aggressors have sought to cut the world apart by submarine and thus to prevail. Twice they have failed. We must make sure that a third similar attempt would

also fail.

For this assurance we need a vigorous program in the hands of a virile and generously supported Navy, in the closest of cooperation with science and technology throughout the country. We need a Navy intent on the full accomplishment of its main mission, and not diverted by the sirens of more spectacular fields, or arguing on the defensive in regard to its importance as compared with any other service.

"I just can't guess," she said, "... it looks like so many things!"

THE WRAPPED BOX in the picture above does look like so many things! It might contain stationery . . . facial tissues ... a jewel box. But ...

It contains Modess! For now Modess comes in a new-shape, different-shape box. So discreet . . . keeps your secret so nicely. Still the same number of the same fine Modess napkins, at the same price. In Regular, Junior, and Super Modess sizes.

Now...Modess in a wonderful new-shape box!

ROCKETS AND JET ENGINES make fighters a terrible enemy for bombers. Fighters locate bombers coming in for attack by use of early-warning radar. With jet engines they can intercept even high-altitude bombers and shoot them down with rockets before they reach their target.

# IN THE AIR, BOMBERS WILL FIND IT TOUGH

STRATEGIC bombing, in which air power carries on warfare on its own, began with the Battle for Britain. Early-warning radar tipped the scales in that first great encounter. The defensive fighter fleets of England were sorely limited in number, they took heavy and almost fatal losses, but by radar they were enabled to meet the enemy, and they prevailed.

What ensued was a race in techniques. The direct clash of fighter fleets played a great part. But dogfighting in the air, as a determining feature of really modern war, is probably now a thing of the past.

The appearance of the jet fighter changed that. Jet engines increased the disproportion between the performance of the long-range bomber and the short-duration fighter. They made speeds in the air so high and turning radii consequently so large that dog-fights became almost impossible. To conduct a dogfight, one has to be able to keep the enemy in sight for more than fleeting seconds. Jet engines increased the effectiveness of the fighters' operation over their own territory with the aid of land facilities, and correspondingly decreased the possibility of defending bomber fleets by accompanying fighters. They may well have made mass bombing at moderate altitudes, against a fully prepared and alert enemy, obsolete.

To understand this one needs to review the radar means employed in defense. First there is the long-range early-warning installation, located on coasts or borders, capable of detecting planes as far as the curvature of the earth permits—at two hundred miles or so if the incoming planes are high. Second is the interceptor-control radar. This places on the cathode ray screen images of all the planes within its range in the sky. Finally, there is the radar on the planes themselves, necessarily of relatively short range because of weight limitations, used to effect the final contact, and even to fire the guns, and available also, of course, to the bombers for defense. There are also the radar and other aids at landing fields—ground-controlled landing systems and the like—to bring fighters or bombers down safely on their darkened fields.

To penetrate a defense thus equipped, night or day, if it is working smoothly and there is enough of it, is an appalling task for any

bomber fleet.

The next point to consider is evidently the bomber that flies high. First, the argument runs, if the bomber flies high enough it can be beyond the range of guns. This is not an open-and-shut matter by any means. The high-altitude bomber with its pressurized cabin is decidedly vulnerable if it is hit at all. Second, if the bomber plane flies high enough, it cludes the pursuit ship unless the latter has very early warning to enable it to climb to altitude and engage. This depends of course upon how far-flung an enemy warning net is available and how fast fighters climb. The concept of immune fleets of bombers is undoubtedly a sound concept from a temporary standpoint, but the matter is not so simple as that of merely making a bomber of high ceiling.

The high bomber has its difficulties when it comes to hitting land targets. It will almost necessarily depend upon radar sighting, and this is useful only where there are prominent features such as lakes or rivers to show up conspicuously on the radar screen. But radar sights can be jammed and deceived, and visual sighting is not much good, even when it is daylight and there are no clouds.

We have one more technique to consider, that of the guided missile. Way back in the early days of aircraft all controls were manual. But soon after large planes came into use there appeared also automatic devices for handling them, notably the automatic pilot. This takes over on a long flight, steers a straight course at constant elevation, allows for all the bumps and deviations, and gives the pilot relief. It is a complex but reliable device, having a gyroscope to give it a sense of direction and pneumatic and hydraulic gears for operating the controls accordingly. It evolved from the gyroscopic compass long used to steer ships at sea.

Now here were all the elements of one sort of guided missile—an aircraft with no crew, adapted to be preset and to fly to a designated target, carrying a load of explosive. It was simple to cause such a device to drop its bomb, or itself, after a flight of specified length. Here was also a true intercontinental guided missile, for airplanes that are not coming back can readily be given long range. All the elements were present for such a development long before the war opened.

CONTINUED ON PAGE 124

GUIDED MISSILES would become the mainstay of ground defense against massed bomber attacks in a future war. Guided by radar, their automatic steering devices (cutaway above) might send them in seemingly errate courses when they pursued planes

employing evasive tactics, as shown in this drawing. Proximity fuzes would detonate the missiles' explosive charges close enough to their targets to destroy them. The driving mechanism of this kind of antibomber missile could be either a turbojet or a ram-jet.

colossal rocket would be necessary for intercontinental warfare with guided missiles. It would be far too expensive and inaccurate anyhow.

What happened? Practically nothing, in any country during the peace.

One thing that was done as the war began was to build semi-conventional airplanes in this manner, usually with all the engines and gear, and at very considerable cost, to use as missiles. They never came into use. They were too costly.

The single thing that did come into use in this field is of more interest. That was the V-1, the buzz bomb that began in June, 1944, to harass London. This was just a self-controlled aircraft of the sort we have described. But it had been redesigned and shaken down for its intended purpose, and that specific purpose was to bomb London, 30 miles in diameter, from a range of about 200 miles. The Germans intended to launch these devices at the rate of about 3,000 per day, and to keep it up for weeks, against London and against the Channel ports, and they intended to do so before we could launch our invasion of the Continent. Had they been

permitted to do so, they might well have stopped the invasion. The missiles carried about a thousand pounds of high explosive apiece. There was no guarantee that the warhead would not contain toxic materials instead. It was a real threat.

The German V-2, unlike the V-1, was a true rocket, not a pilotless aircraft. Its propulsive force was produced by a great blast of hot gases ejected to the rear. It flew in a great arc, 75 miles up into the stratosphere, and descended at 3,000 mph, well above the speed of sound, so that its arrival was not heralded, and one heard the roar of its passage through the atmosphere only after its ton of high explosive had detonated. It was a terror weapon.

It was a guided missile in a certain limited sense. All of its propulsion occurred in its first flight up through the atmosphere, and this was somewhat erratic, so that its flight was watched by radar during this first brief interval, and radio signals were transmitted to cut off its propulsion at the optimum instant. After that it flew in a free trajectory, and its precision was far from good.

The V-2 was nearly at the limit of effective range for a chemically propelled single-stage rocket. Its range can be substantially increased in three ways. First, its payload may be decreased until at

CONTINUED ON PAGE 127

MULTIPHASE ROCKET would begin flight tremendous in size (drawing at top of page). After first phase of its journey ends part of the rocket explodes, launching a smaller rocket for the next phase and so on to the end. The course of a multiphase rocket would be an extremely high trajectory. On a 2.000-mile flight it could be expected to come within 150 miles of the selected target at best.

### FEET BURN?

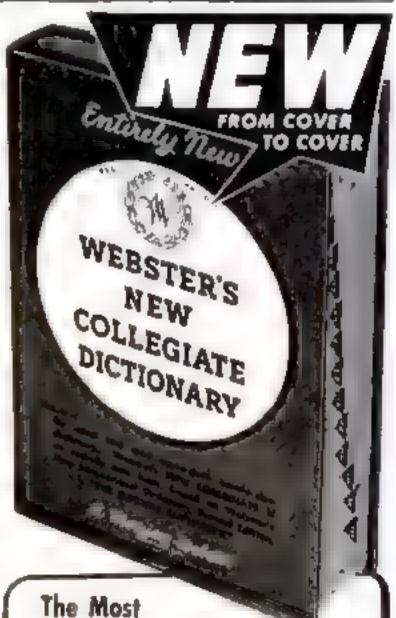

## For FAST RELIEF use this MEDICATED Powder!

No unmedicated powder can relieve your chafed and burning feet as Ammens Powder does!

For Ammens contains three famous medicinal ingredients—gives 3-way medicated skin care: (1) Medicated velice. (2) Medicated protection. (3) Medicated comfort. Soothing and comforting. Promotes healing by helping to protect tender skin against irritation. So soft, it cushions against chafing. Absorbs extra mouture. For medicated skin care, get Ammens Powder today at any drug counter. No luxury tax.

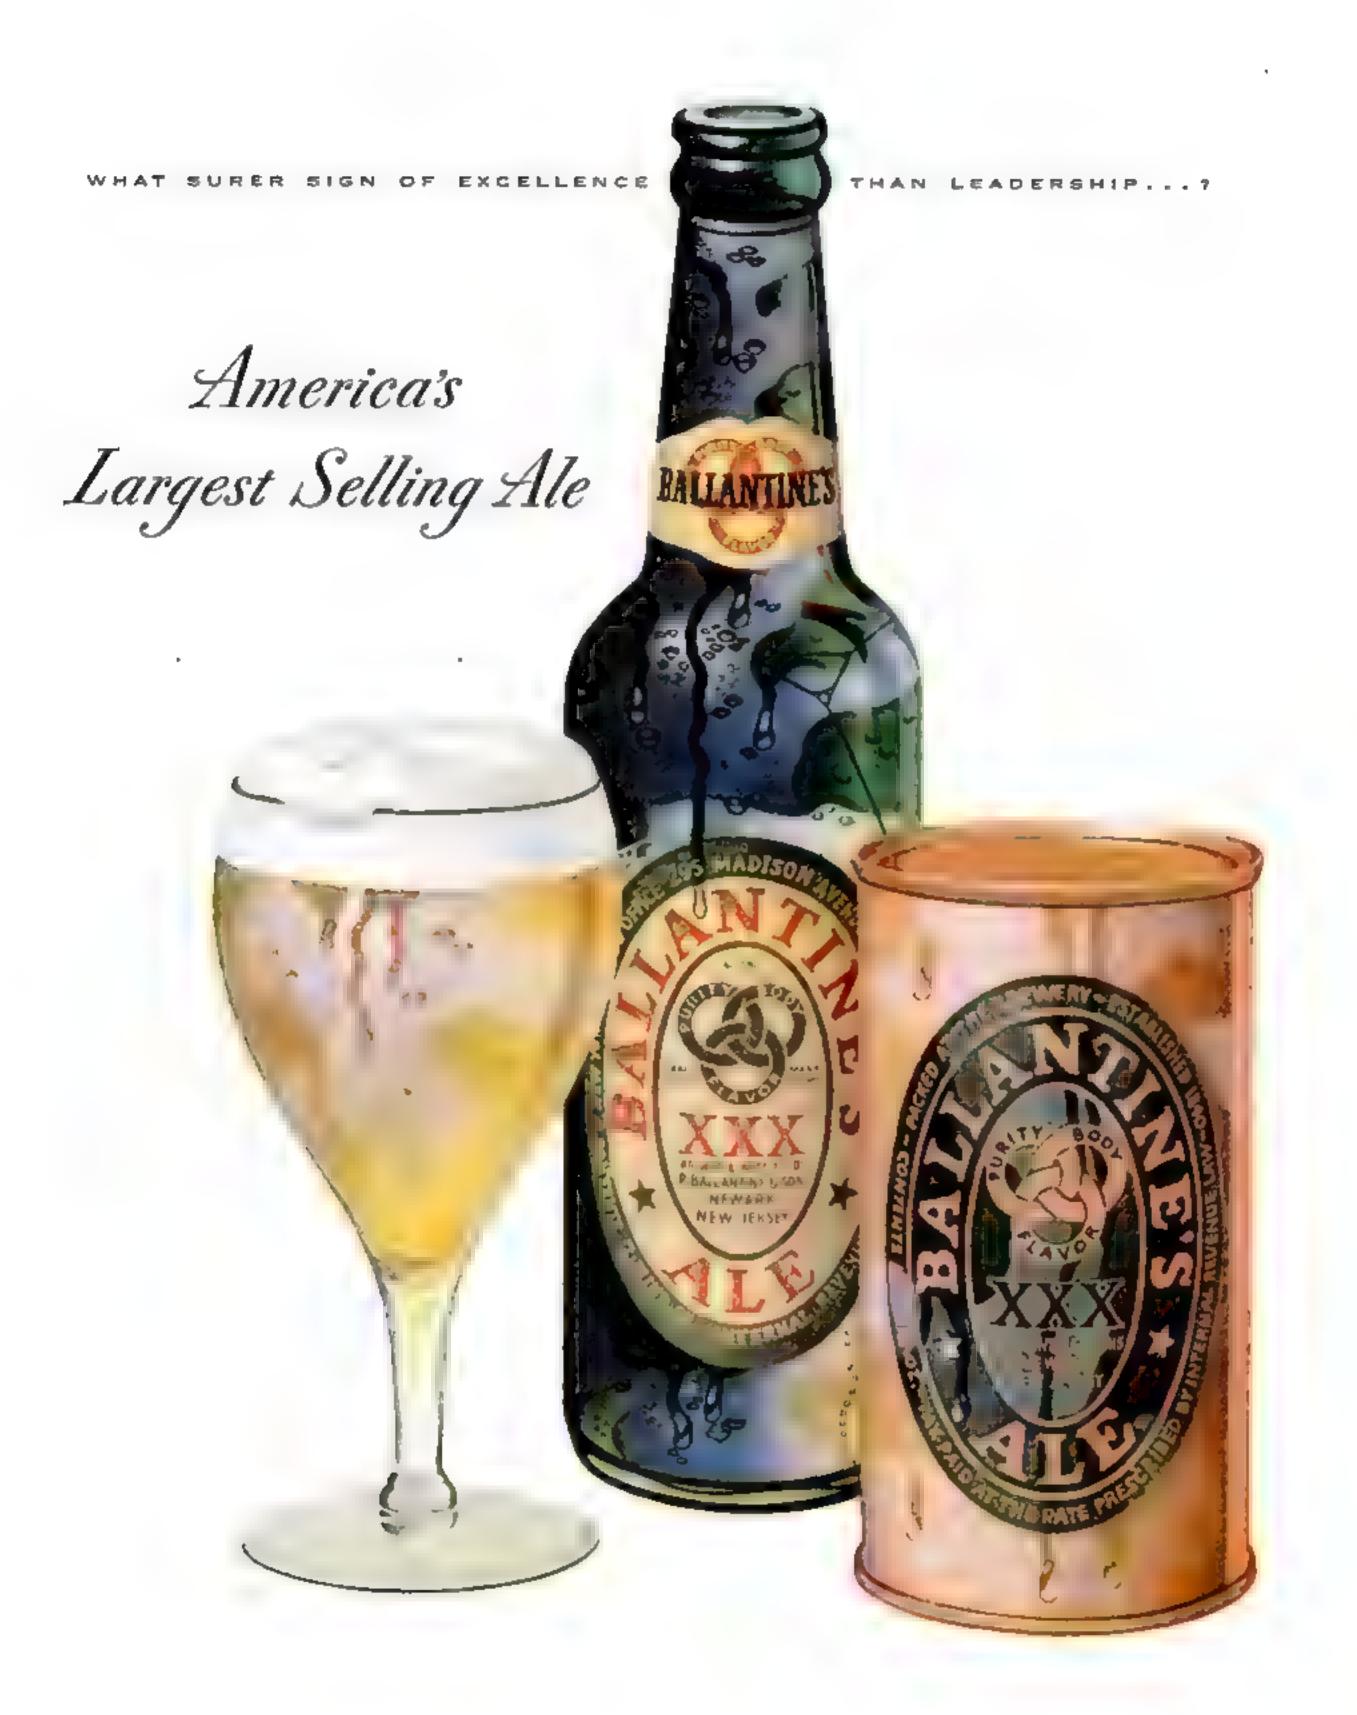

Up-to-Date and Authoritative Handy-Size Dictionary

WIBSTER'S NEW COLLEGIATE DICTIONARY is an entirely new work-enlarged and completely rewritten to cover man's new knowledge in every field. Best for home, school and office because it is based on the big Webster's New International Dictionary, Second Edition, the Supreme Authority, and is characterized by the same outstanding scholarship and accuracy. More than 125 000 entires, 2,500 terms illustrated. Hundreds of new words. Thumb index, \$6.00 and up, depending on binding. At your bookseller's, or write to:

# NYLON

#### gives you something extra

Take it easy, girls—with easy-living nylon! Look glamourous—feel feminine—be sweet as spring—in filmy, entrancing nylon blouses, negligees and lingerie. So packable—and no brow-creasing over washing and ironing. Nylon dries in a wink, needs little or no ironing, wears—in the bargain—like a loving mother's patience!

Take it easy, men—with easy-living nylon! Tell the lady of your home and heart to take a big cut in laundry hours. It's your new nylon socks, shorts 'n' tops, and sweaters, you see! Much less mending, too—nylon's mighty stubborn about wearing out!

Children should be seen more and more in nylon! Try nylon snowsuits, sweaters, slips, panties—never was a fiber so easy to wash, so work-saving, so wonderfully quick-drying.

Easy-living reasons why you want to go mylon: it's lightweight, strong, easy to wash, fast-drying, resists moths, perspiration, flame—and can be "heat set" to hold its shape, no sagging or stretching.

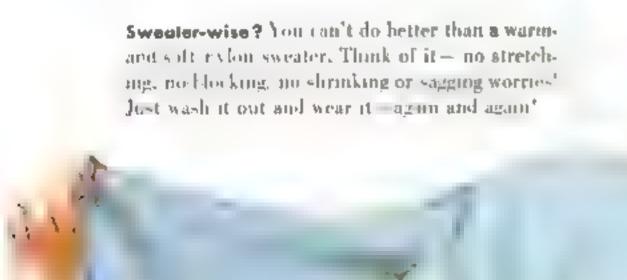

h's toxory, lady—and practical, too—when your blouse is nylon velvet! Something to cheer about: it resists crushing and matting, will wash, never looks tired, wears for many an evening!

Skip mending chores! More leisure time for Mother! Strong spun nylon socks go everywhere teens go—take just as long to wear out! And just a quick dip in the suds leaves them spandy-clean.

Truck fires are sofer, stand up to nine after nine of punishing wair when they're made with long lasting hylon cord. Nylon simply does not give up under heat, impact, fangue or al rasion.

THROUGH CHEM STRY

#### VANNEVAR BUSH CONTINUED

400 miles or thereabouts it will carry no explosive whatever; second, its size and its cost may be increased to carry the present payload a greater distance, though range does not go up in direct ratio to size; third, it can be made into a multistage affair, with an enormous rocket giving birth, when it has done its work, to a smaller one that proceeds from there, and so on. If we are content to pay millions of dollars for a single shot at a distant target, it can be done in this way for any stated distance.

No escape from this dilemma is to be had in new chemical fuels. But I can immediately hear the answer that this situation is all changed now that we have atomic energy available. Perhaps the best reply to this comment is that it is admitted to be a close thing whether atomic energy can compete on a cost basis with chemical fuels for producing energy for commercial purposes under the relatively easy conditions on the ground, where weight and space are not limited, and it is not necessary to release all the available energy in a brief interval; and that a rocket can be made to fly far if one disregards costs. The missile that flew a thousand miles high above the earth might burn itself up like a meteor when it again hit the atmosphere

on its descent, but it can be built.

But can such a missile be made to hit anything at the end of its flight? The V-2 could be made to hit with reasonable frequency within 15 miles of a point of aiming at a range of 200 miles. A similar missile flying 2,000 miles could be depended upon to hit within 150 miles of its target with reasonable frequency. This performance can certainly be improved upon. Conceivably, the missile could be given instruments of precision and could then operate automatically for navigation and guidance. Perhaps it could add sights and homing aids, as the aircraft might. It could then hit a target, perhaps within 10 miles, perhaps even within a mile or two if all went very well indeed.

#### The intercontinental atomic rocket

TS cost would be astronomical. As a means of carrying high explosive, or any toxic substitute therefore, it is a fantastic proposal. If we employed it in quantity, we would be economically exhausted long before the enemy. But it will carry atomic bombs! Here, if at all, the intercontinental rocket might conceivably enter in time. But as long as atomic bombs are scarce, and highly expensive in terms of destruction accomplished per dollar disbursed, one does not trust them to a highly complex and possibly erratic carrier of inherently low precision.

For the near future, the really important and significant field of guided missiles lies in much shorter ranges, above those readily handled by guns, but not so large as to run up size and cost to prohibitive heights. In this range they have applications to extend the range of field artillery, but they have much more important applica-

tions to air warfare.

A number of new engines for propelling aircraft were developed during the war. The simplest by far was the ram-jet. It is simply an open tube. Its own motion produces sufficient compression at the front end to blast hot gas out the rear and keep it going. A fire in the middle of the tube to heat the gas is the essential mechanism.

The ram-jet needs 3,000-mph speed to work well.

To drive a relatively short-range, very high-speed missile the ramjet is almost ideal. It can be shot out of a gun or driven by rockets to reach the desired high speed at which the ram-jet works best, and thereafter it can travel at bullet speed or higher and keep going for ten or perhaps a hundred miles. Can it hit anything? Over short ranges it certainly can be aimed in the vicinity of the target, and from there it appears that reasonably complex homing devices might bring it to the point where its proximity fuze could detonate it with lethal effect to an aircraft. The device is in its infancy, and only time will tell what can be accomplished with it in a practical way. Its significance lies in the fact that it appears to be the great future enemy of the bomber.

Let us assume that devices of this sort can indeed attain a range of, say, 50 miles, and that with that range they can home with precision and a reasonable percentage of hits upon a bomber. Certainly the bomber cannot maneuver out of the way of a missile that comes in with the speed of a shell from a gun. Certainly it cannot survive the explosion of a hundred pounds or so of high explosive detonated in close proximity. Perhaps the bomber can jam the controls of the missile, if it knows the missile is coming and knows its combinations of frequency and the like, but the advantage here seems to lie with those on the ground, who can choose a variety of systems at will, so that if one is countered others are not.

The days of mass bombing may be approaching their end. If so,

it is a good thing for the world.

# THE ATOMIC BOMB IS NOT ABSOLUTE

HAT will war be like if it comes again to the world in total form? We need to examine two situations: one that obtains now, when we have the only stock of atomic bombs, and the other that will be with us when others have stocks,

The atomic bomb is for the immediate future a very important but by no means an absolute weapon, that is, one so overpowering as to make all other methods of waging war obsolete. It will remain in that status as long as there are not great stocks of bombs in the hands of more than one power, and even if this should occur it may remain in that category unless there also then exist means for delivery of the bombs onto enemy targets with at least a moderate degree of assurance.

If all-out war came tomorrow, or in a few years, or at any time before our enemy had a considerable stock of atomic bombs, would it destroy civilization? It certainly would not. War would again be a brutal contest, evil and distressing; the damage would be large, and we should share in it, but we would by no means be knocked out, and we would win it. The whole world knows this. Unless we get soft, unless we are clumsy in meeting the tactics of cold war, we are not in immediate danger.

But what of the beginning of a war when we were not alert, when we were caught off guard, when we were wide open to another Pearl Harbor? We could not open a war in this manner, but our potential enemies could. A dictator, if his control were tight enough and his iron curtain utterly impenetrable, might stage a large surprise opening when he decided to go to war.

He would send his submarine fleets to sea and place them on strategic trade routes, and this preparation would give him a heavy advantage in the undersea warfare to follow. He would mobilize in secret and set his armies in motion so that they would assault strong points before these could be fully manned, and would smash ahead by reason of their momentum. If he had atomic bombs, he would direct them at key cities.

The old scarehead story that atomic bombs could be moved in suitcases may be dismissed. One does not lug atomic bombs about in that fashion. The idea of bringing in the pieces and assembling them in some unnocent-looking warehouse or consulate is probably also far-fetched. It could be done, of course, even though a great deal of skill in assembly is called for. But one bomb thus planted would hardly be an effective opening blow in a war; and the simultaneous smuggling in of a number would involve great risk of detection. Moreover, these things are expensive, as we have discovered in this country, and they would not be risked in many readily recognizable pieces if there were other and surer ways of delivering the finished article.

#### Merchant ships with atomic hombs

THERE is another method that could be a decided perd. This is to carry atomic bombs in innocent-looking merchant craft that can be moored near cities, to be blown up bodily when the time for surprise attack comes, with the crews presumably scuttling off just before if their home government is benevolent enough, and trusting enough, to give them warning. More flexible, and hence more to be feared, is the scheme of planting the bombs on the bottom of harbors, or in canals, through trapdoors in the holds of merchant ships, to be detonated later by time fuze, or even by radio signal. Presumably, bombs thus placed near various cities would be detonated all at once, as the opening shot in a total war. There is no trick method of determining from a distance—or close at hand, for that matter-whether a ship carries such a deadly load. The atomic bomb does not advertise its presence in the unmistakable manner of highly radio-active materials. The damage to a city could be very large if such an infernal machine went off in its harbor, not . so large perhaps as some of the accounts would indicate offhand, for there are limiting factors, but large enough. We have the experience of Bikini to guide us here; the wall of radioactive mist that spread from the underwater test was a very terrible thing.

If we assume, as I think we may, that the world is not now likely to be thrown into open war by accident as it used to be, and that open war will come only if our potential enemy feels it is inevitable and will hence launch it at the most favorable moment for himself,

#### VANNEYAR BUSH CONTINUED

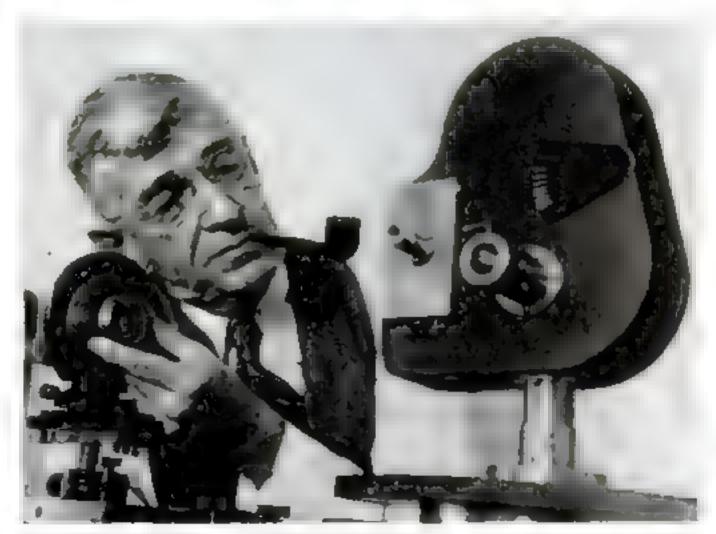

Informal Comfort.

then the attack will come when he feels that his inherent strength plus the surprise factor is sufficiently great to overcome us, and if he feels that time thereafter will be moving against him. We can decrease the value of surprise by staying alert, to an extent, even in peacetime. We cannot reduce the surprise factor to zero, but we can cut it heavily.

The principal element of our preparation for possible surprise attack is an intelligence system of high effectiveness, capable of warning us clearly if an attack is being prepared. No iron curtain is utterly impenetrable. The operations necessary to set in motion a major surprise attack are ponderous and far-reaching. Dictatorship and oppression produce individuals who dare to flee and then dare to talk. There is no reason why we should not know, reasonably well, what is afoot; and if we do, much of the value of surprise is lost. That we can find out things is proved by the President's recent announcement of an atomic explosion. Since the war a Central Intelligence Agency has been created, but it has been under the command of military men whose careers have lain elsewhere, it creaks at the joints, and it is not yet sufficient for its tough task. Scientific intelligence is not conducted well by Mata Hari methods or through agents who know no science, and there is just as much danger of placing scientific intelligence in the hands of those who do not understand as there is in placing any other part of science in the same tender care. We need a modern intelligence agency in every sense of the word, using modern methods as they were partially developed during the last war, not a musical-comedy affair or a stodgy refuge, not even the half-successful affair we now have, but an organization qualified to meet our needs in this kind of world. It can cut down the threat of surprise attack. It does not cost much; by all means let us have it. We ought to know how to build it, after the experience of the last war, for we did not do badly at all on intelligence work then, after we got our hand in and learned how to do it. But the really able men who functioned then have largely scattered into civilian life, the type of ability needed is rare, and the work is not attractive. The task can be done, by an individual of great mental and organizational capacity, having ample authority and the full backing of the President of the United States. As we value our peace of mind we had better be about it.

What will be the nature of future total war if it comes again to the world? It would be highly technical, and it would be fast and furious. It would leave the world shaken and broken. It would cost millions of lives and exhaust the accumulation of treasure of many years. It would not destroy civilization, any more than the last two wars have destroyed civilization, but it would assuredly set it back.

It need not come if we fully maintain our strength. It need not come if we realistically enough and with enough determination resolve that it shall not. It need not come if we really learn to make our democracy work. It need not come at all, for if the strength of free peoples prevents it for a generation, that same strength can then produce a new sort of world in which great wars will no longer occur. For this consummation we face a task that will test us as we have never been tested before, that will test whether we really mean it when we say that we believe in human dignity and human freedom, whether we can really submerge selfishness and petty motive, and bring our enormous latent power to bear, to make our way of life function with true effectiveness for the good of all.

IN HIS PERSONAL LABORATORY in the cellar of the Carnegie Institution Dr. Bush works with instruments he designed himself for optical studies.

BATH in natural element is said to restore "life" to pearls; actually it only cleans them.

#### PEARL FACT AND FABLE

The pearl, symbol of purity, has had other historical significance. In Cleopatra's time powdered pearls were highly regarded as aphrodisiacs. Medieval doctors prescribed pearl powder for impotence and epilepsy, and it was believed pearls worn by unfaithful wives changed color.

The first artificial pearls were made in 1680 by a French fisherman and rosary-maker when he discovered his beads acquired a pearly film when he handled them after a fishing trip, From this chance observation grew the whole artificial-pearl business of coating glass beads with a solution of fish silver. Cultured pearls did not come in until much later. Crude attempts had been made in China for 600 years to grow pearls in hving mussels by placing bits of mud in them, but cultivation was not commonly successful until perfected in 20th Century Japan by Baron Mikimoto. His cultured-oyster pearls were so good that they wrecked the real-pearl market in 1926.

Pearls are formed by nacre, or the protective secretion of an oyster irritated by the presence of a foreign body in its shell. The difference between a real and a cultured pearl lies primarily in the size of the foreign object in the center and the number and thinness of the layers of nacresurrounding it, which give the pearl its luster and translucence. A real pearl has thousands of such layers, a cultured pearl relatively few, depending on the length of time it is left in the oyster. Fine cultured pearls grow for at least three years, can be distinguished from real ones only by lab tests.

THEATER

# "LOST IN THE STARS"

Broadway season's first real hit is a musical play based on the fine novel, "Cry, the Beloved Country"

TODD DUNCAN AND 10-YEAR-OLD HERBERT COLEMAN ARE HIT ACTORS OF SHOW

THE SIMPLE PASTORAL BEAUTY OF SOUTH AFRICA IS CONVEYED BY THIS PARADE OF NATIVES NEAR THE HUMBLE HOME OF THE PLAY'S HERO, STEPHEN KUMALO

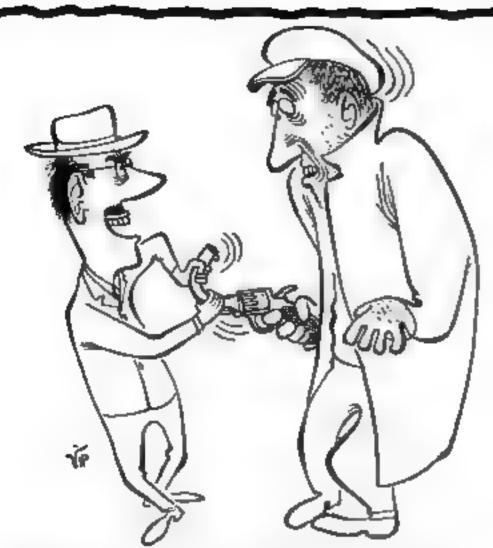

No matter how many pretty good shows have already opened, Broadway's season never really gets rolling until, soon or late, the first big hit comes along. Last week Broadway finally had a winner in Lost in the Stars, a musical play adapted from Alan Paton's fine novel, Cry, the Beloved Country. Paton's story, which deals with Negro problems in South Africa, was written with the same passionate concern for oppressed people as Uncle Tom's Cabin and is almost as well suited to the stage. As a novel it became a U.S. best-seller in 1948, has been translated into 12 languages and has outsold every book

in South Africa with the exception of the Bible. As a theater piece it ought to enjoy the same worldwide success.

The adapters of the play, Maxwell Anderson and Composer Kurt Weill, call their work a "musical tragedy." It starts slowly and deliberately to tell Paton's story about Stephen Kumalo, the humble Negro preacher who leaves his flock in the hills of Ixopo to look for his son Absalom in the great city of Johannesburg. Absalom has fallen in with bad company and in a moment of panic shoots a white man who has always befriended Negroes. Out of

this tragedy Stephen loses both his son and his faith in God. But at the end, in a moving scene, he recaptures his faith and finds a friend in the father of the man his son had killed.

As a background to this drama, Weill's music sometimes skids close to banabty. But it is beautifully sung by a mixed white and Negro cast, especially by Todd Duncan as Stephen Kumalo, and a 10-year-old named Herbert Coleman does a bouncing show stopper song called Big Mole. Lost in the Stars is a credit to its creators because they have retained the spirit of a powerful and reverent book.

"You can't scare me. Besides — all my cash is in American Express Travelers Chequesi"

Turning the tables on even the smartest crook is easy when you carry American Express Travelers Cheques. Until you sign them, no one else can spend them. So if they are lost or stolen, you get a quick refund. And you can spend them anywhere because these Travelers Cheques are the most widely known and accepted in all the world.

#### "Lost in the Stars" CONTINUED

ALAN PATON visits a Zulu school like one where as a young man he used to teach. Because of crowded conditions, students work outdoors on tables.

#### PATON AND HIS BELOVED COUNTRY

Before he became celebrated all over the world as an author. Alan Paton was celebrated around the city of Johannesburg as "the man who pulled up barbed wire fence and planted geraniums." He earned this poetic description as principal of the Diepkloof Reformatory which housed 650 African youths imprisoned for offenses ranging from petty theft to murder and rape. Changing the rigid reformatory rules, Paton introduced—slowly and with many setbacks—a system of "graduated freedom" by which an inmate won privileges and release.

Along with his deep concern for the welfare of South African natives, Paton, who is now 46, has always had an almost spiritual love of the land. Born in South Africa of English parents, Paton in his youth tramped hundreds of miles over the majestic province of Natal. At the age of 21 he taught a tiny country school at Ixopo (above) and later became a college teacher at Maritzburg. He married and had two sons. He filled his house with boys over weekends and took them on camping trips to the spots he loved. By 1935 he felt he could best serve his country and his ideals by tackling the reformatory job.

Paton had always wanted to be a poet and novelist, but not until after the war, when he traveled abroad to study penal reforms, did his creative fires really blaze up. Suddenly on a train from Stockholm he began talking out loud to the landscape. Then he began to write. Three months later in San Francisco he had combined brilhantly his literary and humanitarian impulses, and finished Cry, the Beloved Country.

SCENE OF THE NOVEL is Carisbrooke, where the natives above the wall-ing at railroad stop. This is the place described in the poets the pinn not done the Beloved Country: "There is a lovely road that runs from Ixopo into the hills. These hills are grass-covered and rolling, and they are lovely beyond ansinging of it. The road climbs seven miles into them, to Carisbrooke and rolling there, if there is no mist, you look down on one of the fairest valleys of Atrica."

#### Life's Visit

MENOMINEE COACH WEARS HAIR RIBBON AT PEP RALLY

# MENOMINEE VS. MARINETTE

# Fierce high school football foes meet for their 53rd annual game

On opposite banks of the Menominee river, which separates Michigan from Wisconsin, are the twin towns of Marinette. Wis. and Menominee, Mich. They are brotherly enough during most of the year, but every fall they are exploded by a football rivalry if anything keener than that which convulses high school communities all over the U.S. When the Menominee Maroons meet the Marinette Marines in a series which since 1894 has produced 25 victories for Marinette, 21 for Menominee and six ties, all else is forgotten, and for a few days students, parents, townspeople and officials alike are caught up in a frenzy of pep rallies, parades and wild snake dances at night across the bridge between the towns. This year Marinette was favorite. To see who won, turn page.

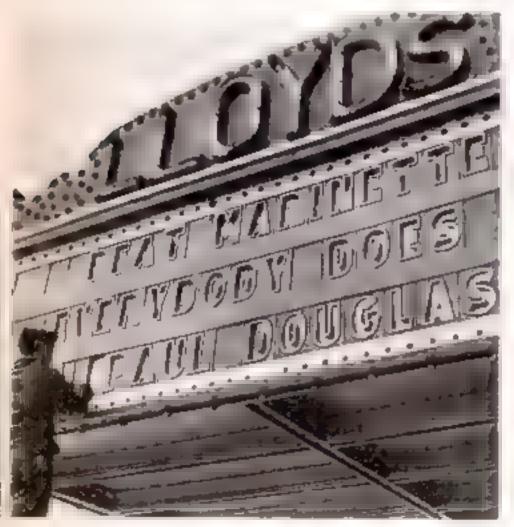

CONGA LINE of Menominee students kicks its way to a pep rally after a warm-up at the school where all students marched through the halls wearing pigtails or bair ribbons.

MARINETTE PEP SQUAD, consisting of girls dressed as players, pot on a dimmy jootball game in street and "defeated" Menominee. Here they well. Who sail right?

The team. Who says so? We say so. Who are we? MARINETTE!" School officials encouraged formal pep raffies to keep students basy and stop traditional fig. is on prage.

**BEAT MARINETTE** goes up in bright lights on the Menominee theater which is showing Freezhody Does It.

INSIDE THEATER Menominee rooters present odd-shaped team of girls purporting to be Menominee players.

OFF TO THE GAME go two Meromore merchants. They cheerfully let students scrawl slogans on windows.

# For your Golden Boy

and always finds—in SWANK accessories.

SIRK - @ Person, Inc., Attichore, Mass.

#### Menominee vs. Marinette continued

MARINETTE COACH Howie Stiehm nervously grits his teeth. "There's a saying," he says, "no coach stays at either school after three M&M defeats."

MARINETTE M is perfectly formed by high-school band during half-time period. The stadium was a sellout. More than 8,000 people came to see game.

MARINETTE CASUALTY was Paul Christopherson, here reaching for a towel to wipe dirt off his face. He got a kick in the ribs but finished the game.

MENOMINEE COACH Ken Radick worries at game. He got little rest the night before as old grads kept calling him and telling him how to win the game.

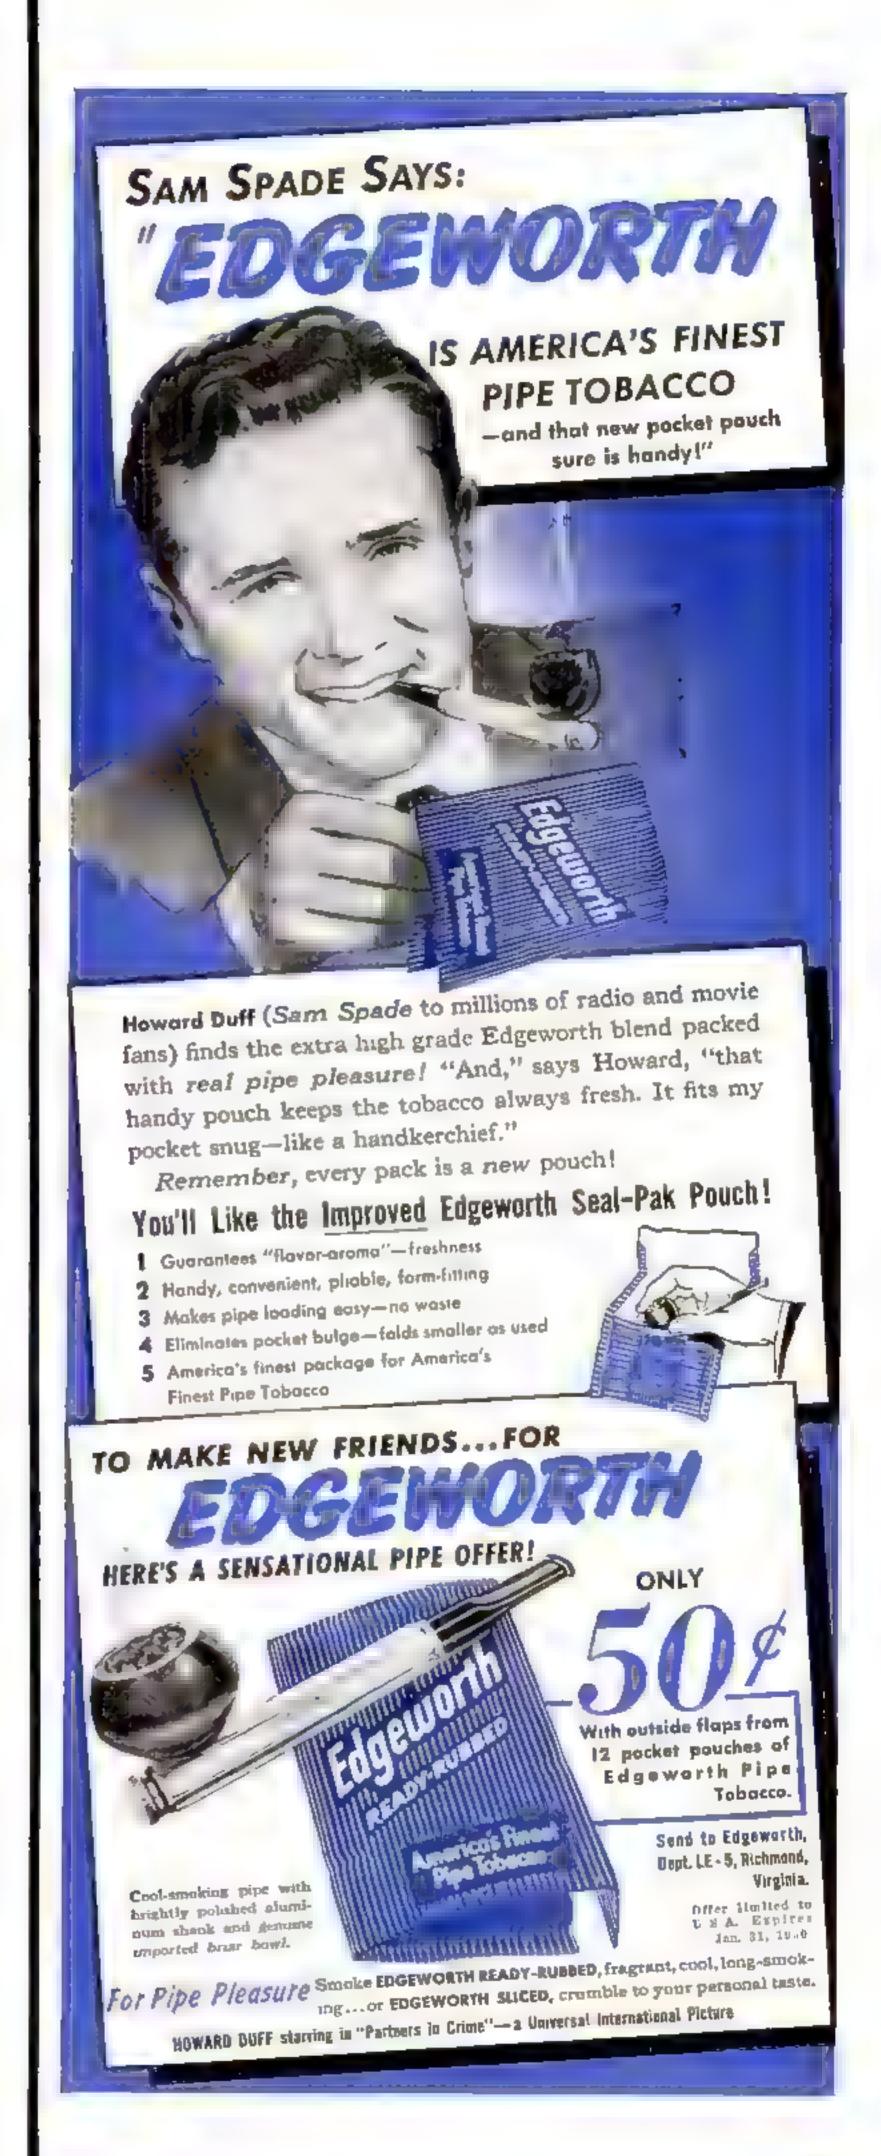

MENOMINEE M is five yards wider than Marinette's and as well formed. Both schools have fine bands, and both bands got new uniforms for the game.

MENOMINEE CASUALTY Bob Amory lost helmet in game and got kn ked in the head. He was carried off on a stretcher but made the dance that might

IN SMOCK AND SCOWL, COOKIE GETS READY TO TAKE HIS FIRST PICTURE

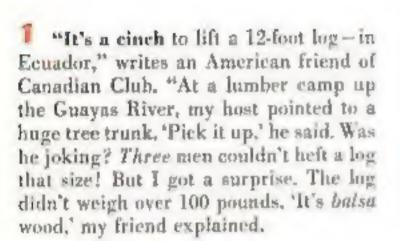

# CHIMP PHOTOGRAPHER

"Life" publishes first picture taken by an ape

A friendly chimpanzee named Cookie has posed patiently for amateur photographers at the St. Louis Zoo for nine years. Recently he had a chance to find out what things look like from the other side of the camera when Life Photographer Bernard Hoffman, impressed by Cookie's intelligence, decided to give him lessons. Setting up an old-fashioned studio camera, Hoffman showed Cookie how to stand professionally beside it and squeeze the bulb. To coax his pupil along Hoffman bribed him with Popsicles. Four days and plenty of Popsicles later Cookie was ready and the camera was loaded with film. For the result, see below.

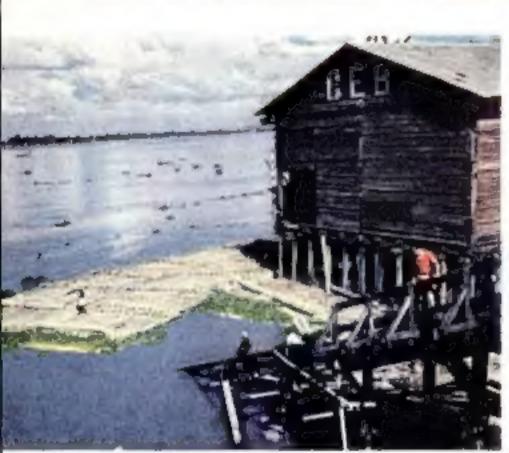

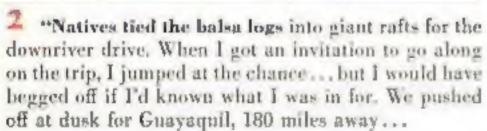

Every man is Superman in this neck of the woods

5 "Logs lighter than cork, a river that runs backwards—Ecuador is sure full of surprises,' I said. 'But this baffles me. How does Canadian Club get way down here?' 'No mystery there,' said my host. 'I just asked for the best in the house... and that means Canadian Club wherever you

"105 degrees in the shade and hardly any shade! To make matters worse, the ocean tide swept in from the Pacific each day, making the long coastal river run backwards! So every day we had to tie up for twelve long hours till ebb tide. It took five grueling weeks to reach Guayaquil.

go.'" Why this worldwide popularity? Canadian Club is light as scotch, rich as tye, satisfying as bourbon. You can stay with it all evening long... in cocktails before dinner and tall ones after. That's what made Canadian Club the largest-selling imported whisky in the United States.
